Executive summary

Purpose

Aurecon Australasia Pty Ltd has been commissioned by Brisbane Airport Corporation (BAC) to prepare an Environmental Assessment Report for the land development of the proposed Brisbane Airport Auto Mall (the Project).

The objective of this Environmental Assessment Report is to identify potential environmental issues and impacts associated with the Project and recommend appropriate mitigation measures to ensure identified impacts are minimised and managed through the design and construction of the Project.

This Environmental Assessment Report also demonstrates that the Project can proceed in accordance with the relevant guidelines and legislation and ensure there is no significant impact on environment and heritage matters.

Key findings

An assessment of potential environmental impacts from the Project has been conducted, including consideration of contaminated soils and groundwater, acid sulfate soils, ecology, hydrology, water quality, air quality, noise and vibration, cultural heritage and traffic and aviation safety matters. Mitigation measures have been developed to ensure these identified impacts are minimised and managed.

The presence of potentially contaminated and acid sulfate soils within the Project site is a key environmental consideration for the Project and will need to be managed during Project works, including the implementation of an Erosion and Sediment Control Plan and Acid Sulfate Soil Management Plan, as well as groundwater monitoring during fill placement and surcharging activities.

This environmental assessment has also found that dust generation from construction earthworks has the potential to impact on the Kingsford Smith Memorial and other nearby sensitive receptors. Appropriate dust suppression techniques will be employed to ensure impacts from dust generation are minimised. In addition, baseline and construction dust deposition monitoring at five nominated locations will be conducted throughout Project works.

Background noise and vibration monitoring will be required to provide a benchmark to assess construction noise and vibration associated with the Project. Mitigation measures to reduce noise and vibration impacts, particularly at the nearby Kingsford Smith Memorial, have been recommended to ensure construction activities do not have a detrimental impact on the Memorial. In addition, further mitigation will be achieved through implementation of management measures such as a building assessment on the Kingsford Smith Memorial and the Stop Work Procedure for unexpected cultural heritage finds.

This Environmental Assessment Report concludes that the Project will have minimal impact on the environment and heritage matters if the recommended mitigation and management measures are implemented.

1 Introduction

1.1 Background

Aurecon Australasia Pty Ltd has been commissioned by Brisbane Airport Corporation Pty Ltd (BAC) to prepare an Environmental Assessment Report (EAR) for the land development of the proposed Brisbane Airport Auto Mall (the Project).

The proposed Project will involve the development of a multi-purpose automotive business precinct situated around a central 2.5 km test track. The proposed Auto Mall will include flagship dealerships, exhibition and conference activities, hotels, event areas, driver training schools and regional offices, designed around a multi-purpose test track. The Project construction has been divided into two distinct phases; Phase 1 includes the land clearing, ground improvement and bulk earthworks associated with developing the land, while Phase 2 includes site preparation and future infrastructure works.

The Project site is a 55.7 ha parcel of undeveloped low lying bushland and small mangrove communities enclosed by Moreton Drive, Airport Drive and Nancy Bird Way and located in close proximity to the Brisbane International Terminal (Airport Central Precinct) (refer Figure 1.1).

This report provides the findings of Aurecon's assessment of the baseline environmental conditions within the Project site and discusses mitigation measures to avoid any significant environmental impacts from the land development phase of the Project.

1.2 Objectives

The objectives of this EAR include:

- Review information from previous studies in the area
- Identify potential environmental issues and impacts associated with the Project
- Develop appropriate mitigation measures to be implemented during design and construction of the Project to ensure identified impacts are minimised and managed
- Demonstrate that the Project can proceed in accordance with the relevant guidelines and legislation to ensure no significant impact is caused

1.3 Report structure

The structure of this EAR is shown in Table 1.1.

Table 1.1 Report structure

Section number	Aspects addressed in this EAR	Overview of section
1	Introduction	■ A general overview of the Project background context ■ Details on the report structure ■ Objectives of the EAR ■ Details of the Project proponent

Section number	Aspects addressed in this EAR	Overview of section
2	Project description	■ Project justification and objectives ■ Design and scope of works ■ Development phases
3	Legislative requirements	■ Consistency with Commonwealth legislation ■ Consistency with Airport policies and planning documents ■ Consistency with State and Local Government legislation and planning documents
4	Land use	■ A review of the existing land uses surrounding the Project site ■ Identification of potential impacts and mitigation measures
5	Geology, soils, topography and contaminated land	■ An assessment of the existing geological, soils and topographic characteristics within and surrounding the Project site ■ An assessment of contaminated land based on Golders (2016a; b) investigations ■ An assessment of acid sulfate soils based on Golders (2016c; d) investigations ■ Identification of potential impacts and mitigation measures
6	Flora and fauna	■ Assessment methodology including scope, documents reviewed and investigations undertaken ■ Assessment of the existing ecological values within and directly adjacent to the Project ■ Identification of potential impacts and mitigation measures
7	Hydrology and water quality	■ An assessment of water quality within and adjacent to the Project site ■ Consideration of the water quality objectives and limits for watercourses downstream of the Project site to determine appropriate discharge limits for the Project during construction ■ Identification of potential impacts and mitigation measures
8	Air quality, odour and dust management	■ A desktop assessment of the existing air quality and climatic conditions within and surrounding the Project site. ■ Air quality criteria have been assessed to determine the most appropriate criteria to be applied to the Project during construction ■ Identification of potential impacts and mitigation measures
9	Noise and vibration	■ An assessment of the existing noise environment within and surrounding the Project site ■ Noise and vibration criteria have been assessed to determine the most appropriate criteria to be applied to the Project during construction ■ Identification of potential impacts and mitigation measures
10	Social and economic issues	■ An assessment of the social environment issues within the Project site ■ Identification of potential stakeholders within/surrounding the Project site ■ Identification of potential impacts and mitigation measures
11	Cultural heritage	■ An assessment of the cultural heritage values within the vicinity of the Project ■ Identification of potential impacts and mitigation measures
12	Waste and hazardous goods management	■ A desktop investigation of the possible types of waste generated during the construction phase of the Project ■ Identification of potential impacts and mitigation measures

Section number	Aspects addressed in this EAR	Overview of section
13	Traffic and aviation safety	■ An assessment of the potential impacts to aviation safety as a result of the construction of the Project ■ Identification of potential construction traffic impacts and mitigation measures
14	Landscape and visual amenity	■ An assessment of the existing landscape and visual amenity within and adjacent to the Project ■ Identification of potential impacts and mitigation measures
15	Conclusions and recommendations	■ A summary of the key findings of the environmental assessment that will need to be considered throughout the design and construction of the Project
-	References	■ A list of reference material used during the preparation of this EAR
-	Appendices	■ The appendices include technical information and reports that support the discussion provided within the body of the EAR

1.4 Project proponent

All works associated with the Project are on land within the existing boundary of Brisbane Airport. BAC is an “airport-lessee company” under the *Airports Act 1996*.

The proponent for this proposed Project is:

Brisbane Airport Corporation Limited
11 The Circuit
Number 1 Airport Drive
Brisbane Airport QLD 4008

The contact in connection with this proposal is Peter Boyle, Civil Project Manager – Airport Construction Assets Group, BAC, telephone (07) 3406 3215.

2 Project description

2.1 Project justification and objectives

This EAR provides an assessment of the potential environmental impacts that may occur as a result of design and construction of the land development phase of the Project, including land clearing, ground improvement works and bulk earthworks.

Project construction has been divided into two distinct phases. Phase 1 includes the land clearing, ground improvement and bulk earthworks associated with developing the land while Phase 2 includes site preparation and future infrastructure works.

2.2 Project development phases

Phases 1 and 2 are envisaged to be delivered in three stages to provide BAC with suitably prepared land from 2021, as detailed in Table 2.1. The timing of the delivery of these stages is preliminary only and based on the program provided in Appendix A. These timings may be subject to change depending on the final earthworks and surcharging solution. The indicative staging configuration is illustrated in Figure 2.1.

Table 2.1 Development timing

Stage	Area (ha)	Planned start date	Bulk earthworks complete and surcharge removed
1	33.6	Quarter 3 2017	Quarter 3 2020
2	6.9 + 2.23 (flood storage)	Quarter 4 2018	Quarter 4 2020
3	12.0 + 1.01 (flood storage)	Quarter 1 2021	Quarter 4 2022

2.3 Location of proposed development

The site is a 55.7 ha parcel of undeveloped low lying bushland and small mangrove communities enclosed by Moreton Drive, Airport Drive and Nancy Bird Way and located in close proximity to the Brisbane International Terminal (Airport Central Precinct). The Project will also involve modification to several existing drainage structures under the surrounding roadways, including Moreton Drive, Airport Drive and Nancy Bird Way. In particular, the Banksia drainage backflow into the site will be bunded to prevent tidal water access. The bund will be fitted with a pipe and valve to allow release of any build-up of water from inside the Project site.

The Project site is moderately disturbed and predominately contains casuarina plantations with some mangrove communities and grasslands. The Project site is traversed by two main drainages lines that connect to Landers Pocket Drain, including two that flow from Banksia Place, under Nancy Bird Way and another that flows across the Project site from Moreton Drive. There are a number of existing fire trails and tracks that run through the Project site, which will be removed during Project works. Access to the Project site is currently via a number of security gates along Airport Drive as well as unsecured access from Nancy Bird Way. There is no site access from Moreton Drive.

Figure 1.1 shows the location the Brisbane Airport Auto Mall and surrounding area.

2.4 Proposed design/scope of works

The Project site is located in a vacant low lying area within the Airport Central (Airport Drive West) sub-precinct of the Brisbane Airport. Based on the Engineering Concept Design (Opus 2016), the approximate excavation and fill volumes (excluding requirements for surcharge) include:

- Excavation: 67,000 m^3 and 34,800 m^3 (flood storage basins)
- Fill: 380,000 m^3
- Drainage layer: 8,400 m^3 (wick drains)

The Project may undertake a 24 hour earthwork operations as well as material processing, including sorting, crushing, processing and stockpiling. Site access may be obtained from Airport Drive (for Stages 1, 2 and 3), initially with a left in/left out arrangement, and also from Nancy Bird Way (for Stages 1 and 3). Access from Moreton Drive (left turn only) may also be required as an option. Site access arrangements will be confirmed during detailed design.

The following activities are required to prepare the site for the future Auto Mall:

- Site clearing and partial grubbing
- Bulk earthworks, including but not limited to:
  - Supply and place drainage layer
  - Supply and place settlement plates
  - Supply, place and compact imported fill material
  - Processing of material, including earth and rock, for use as fill material, including sorting, crushing and stockpiling
  - Undertake appropriate erosion and sediment control measures
  - Construct temporary drainage works and detention basins as required
  - Construct geogrid and slope stability measures
- Surcharge, including:
  - Supply, place and compact imported material (approximately 336,000 m^3) suitable for use as surcharge fill on future stages as surcharge:
    - Roads and building areas: from 3.75 m Aerodrome Datum (AD) to 7.0 m AD
    - Track area: from 3.75 m AD to 6.0 m AD
  - Supply and install wick drains to parts of the Project site to speed up the consolidation process
  - Construct geogrid and slope stability measures
- Drainage works, including:
  - Existing drainage systems are intended to be retained for Stage 1 (refer Figure 1.1). In Stages 2 and 3, the majority of flows will be captured by a proposed drainage channel, which will be constructed around the perimeter of the Project site
  - Installation of bunds to prevent tidal water access from Banksia precinct. The bund will be fitted with a pipe and valve to allow release of any build-up of water from inside the Project site
  - The perimeter drain will act as a sediment control mechanism to enable runoff from earthworks to be captured and treated before being discharged off site
  - Progressive installation of storage basins/channels with a capacity of approximately 44,200 m^3 for flood storage during storm events
  - Future installation of flap/tidal gates major culverts under Moreton Drive and Nancy Bird Way to prevent back flow from the regional or storm tide flood events which would impact on the Project site's flood immunity, as part of the Phase 2 works. Installation of temporary earthen bunds and pipes with shut off valves will be installed to prevent tidal water ingress to the Project site, as part of Phase 1 works

- Acid sulfate soil (ASS) treatment, including:
  - Staged construction of a lime cut-off trench along the western, southern and eastern boundaries of the Project site prior to commencement of filling/surcharging, within 50 m of the end of the installed trench until fully completed (northern boundary already contains suitable buffering capacity)
  - Placement of a 10 m wide strip of surface lime ‘guard layer’ under the perimeter of each surcharge area prior to placement of the drainage blanket where wick drains are installed, to neutralise any seepage resulting from wick drains
  - Excavated ASS materials to be managed by stockpiling within a nominated section of the fill/surcharge platform and neutralising by lime treatment
  - Progressive construction of the perimeter drain in staged sections to monitor and treat groundwater discharges
  - Incorporation of lime into the walls and base of the perimeter drain to neutralise discharges to groundwater (higher lime application rates are required along the western site boundary to buffer acidic groundwater)
  - Isolation of drains from external discharge

3 Legislative context

3.1 Legislative requirements

The Project is located on Commonwealth owned Airport land and is governed by Commonwealth legislation, primarily the *Airports Act 1996* and the *Airports (Environment Protection) Regulations 1997*. Only Commonwealth legislation applies. However, if the Commonwealth legislation is silent about an aspect of the development, BAC representatives and/or the Airport Environment Officer (AEO) may choose to observe the requirements of State legislation.

3.2 Consistency with Commonwealth Legislation

Commonwealth legislation applicable to this Project includes:

- *Airports Act 1996* (Airports Act)
- *Airports (Environment Protection) Regulations 1997* (AEPR)
- *Airports (Protection of Airspace) Regulation 1996*
- *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act)
- *National Environment Protection Council Act 1994*

The relevance of each legislative instrument is assessed below.

3.2.1 Airports Act 1996

3.2.1.1 Background

The Airports Act regulates all Commonwealth owned airports within Australia. The Act specifies that there must be an Airport Master Plan and an Airport Environmental Strategy for all privately leased Commonwealth owned airports within Australia. The Airports Act and associated regulations set out an Australian Government regime for land use planning and the regulation of building activities at airports. In particular:

- Section 70(2) states that a final master plan for an airport is to:
  - *a) Establish the strategic direction for efficient and economic development at the airport over the planning period of the plan*
  - *b) Provide for the development of additional uses of the airport site*
  - *c) Indicate to the public the intended uses of the airport site*
  - *d) Reduce potential conflicts between uses of the airport site, and to ensure that uses of the airport site are compatible with the areas surrounding the airport*
  - *e) Ensure that all operations at the airport are undertaken in accordance with relevant environmental legislation and standards*
  - *f) Establish a framework for assessing compliance at the airport with relevant environmental legislation and standards*

g) *Promote the continual improvement of environmental management at the airport*

- The Airports Act requires a 'major development plan (MDP)' for each major development at a regulated airport. Section 89 of the Airports Act prescribes those activities that are included as a 'major airport development'
- Section 112 specifically excludes State laws from applying in relation to land use planning and the regulation of building activities at airports
- Section 132 of the Airports Act provides that the regulations (eg the AEPR) may make standards and impose requirements that are to be complied with in relation to, or in relation to the prevention or minimisation of:

  a) *Environmental pollution (including air, water or soil pollution) generated at airport sites; or*

  b) *Impacts on biota or habitat; or*

  c) *Interference with sites of heritage value; or*

  d) *Interference with sites of significance to Aboriginal or Torres Strait Islander people; or*

  e) *The emission of noise generated at airport sites (other than noise generated by aircraft in flight); or*

  f) *The disposal or storage of waste at airport sites.*

- The Airports Act also provides for the monitoring, and remedying breaches of, environmental standards at airports
- Section 182 provides for the protection of airspace around airports and states that activities that result in intrusions into prescribed airspace are called 'controlled activities', which require approval

3.2.1.2 Relevance to the Project

Section 70(2) – Master planning

BAC prepares a Master Plan every five years in accordance with the requirements of the Airports Act. The applicability of the BAC Master Plan to the Project is discussed in Section 3.3.2 below, while the Project's compliance with the Airport Environment Strategy (BAC 2014a) is discussed in Section 3.3.4.

Section 89 – Need for an MDP

In reviewing the definitions contained in Section 89 of the Airports Act, it is considered that an MDP is not required for the Project. The bulk earthworks component of the Project is not considered to be building works as it relates to clearing, filling, surcharging and associated environmental management works only. With regards to environment and heritage matters, provided that the mitigation measures outlined in this EAR are implemented during construction, the Project is considered to:

- Not create a significant environmental or ecological impact
- Not impact on an area identified as environmentally significant in the Brisbane Airport Environment Strategy (AES)
- Not create a significant impact on the local or regional community

Section 112 – Relationship to State regulations

The Project is exempt from complying with State laws in relation to land use planning and building activities. It should be noted that BAC maintains that wherever reasonable and practicable, they will aim to comply with State legislation in relation to the protection of the environment (BAC 2014a).

Section 132 – Environmental management requirements

A discussion on the applicability of the AEPR to the Project is provided in Section 3.2.2.

Section 182 – Approval for controlled activities

Section 182 of the Airports Act outlines the following to be controlled activities:

a) *"Constructing a building, or other structure, that intrudes into the prescribed airspace;*

b) *Altering a building or other structure so as to cause the building or structure to intrude into the prescribed airspace*

c) *Any other activity that causes a thing attached to, or in physical contact with, the ground to intrude into the prescribed airspace*

d) *Operating a source of artificial light, where:*

   i. *The intensity of the light emitted exceeds the level ascertained in accordance with the regulations; and*

   ii. *The light is capable of blinding or confusing pilots of aircraft operating in the prescribed airspace*

e) *Operating prescribed plant, or a prescribed facility, that reflects sunlight, where:*

   i. *The intensity of the reflected sunlight exceeds the level ascertained in accordance with the regulations; and*

   ii. *The reflected sunlight is capable of blinding pilots of aircraft operating in the prescribed airspace*

f) *An activity that results in air turbulence, where:*

   i. *The level of the turbulence exceeds the level ascertained in accordance with the regulations; and*

   ii. *The turbulence is capable of affecting the normal flight of aircraft operating in the prescribed airspace*

g) *An activity that results in the emission of smoke, dust or other particulate matter, where:*

   i. *The emission exceeds the level ascertained in accordance with the regulations; and*

   ii. *The smoke, dust or particulate matter is capable of affecting the ability of aircraft to operate in the prescribed airspace in accordance with Visual Flight Rules*

h) *An activity that results in the emission of steam or other gas, where:*

   i. *the emission exceeds the level ascertained in accordance with the regulations; and*

   ii. *the steam or gas is capable of affecting the ability of aircraft to operate in the prescribed airspace in accordance with Visual Flight Rules."*

The Project may result in undertaking the controlled activities identified under item c), d), e) and g) in Section 182 of the Airports Act. If undertaking a controlled activity, an approval must be obtained. Section 7 of the *Airports (Protection of Airspace) Regulations 1996* outlines the requirements to obtain approval. The *Airports (Protection of Airspace) Regulations 1996* is discussed in Section 3.2.3.

Section 13 of this EAR provides an assessment of the existing aviation safety requirements for Brisbane Airport and identifies the potential impacts to aviation safety as a result of the Project. Mitigation measures are then provided to ensure that during the Project, BAC meets their duties with regards to managing impacts to aviation safety.

3.2.2 Airports (Environment Protection) Regulations 1997

3.2.2.1 Background

The AEPR ensures the environmental regulation of all Commonwealth owned airports within Australia. The objectives of the AEPR are:

a) *"To establish, in conjunction with national environment protection measures made under section 14 of the National Environment Protection Council Act 1994, a Commonwealth system of regulation of, and accountability for, activities at airports that generate, or have potential to generate:*

   i. *Pollution; or*

   ii. *Excessive noise, and*

b) *To promote improving environmental management practices for activities carried out at airport sites."*

Section 4.01 of the AEPR states that:

"the operator of an undertaking at an airport must take all reasonable and practicable measures:

a) *To prevent the generation of pollution from the undertaking; or*

b) *If the prevention is not reasonable or practicable – to minimise the generation of pollution from the undertaking".*

The requirements for managing the following environmental aspects on Airport land are outlined in the following sections of the AEPR:

- Air quality – Section 2.01
- Surface and groundwater quality – Section 2.02
- Soils – Section 2.03
- Flora and fauna – Section 4.04
- Cultural heritage – Section 4.04 and 4.05
- Noise – Sections 4.06 to 4.09

In addition to the assessment of environmental aspects within the AEPR, baseline monitoring will be conducted within and surrounding the Project site for water, noise, air quality and vibration. Baseline criteria will be established to assess the Project's performance and be used to demonstrate environmental compliance with existing conditions. For contaminated land, procedures will be undertaken as per the *National Environment Protection (Assessment of Site Contamination) Measure 1999* (Amendment 1, 2013) (NEPM 2013) requirements (refer Section 3.2.5) and in consultation with the AEO.

3.2.2.2 Relevance to the Project

The provisions of the AEPR are the overarching environmental requirements by which the Project shall be managed. The following sections state the requirements under the AEPR in relation to the environmental aspects and refer to the relevant sections of the EAR within which environmental aspects are further detailed. It is considered that the mitigation measures outlined for each environmental aspect will enable BAC to meet their duties with regards to the management of environmental impacts under the AEPR.

Air quality

Section 2.01 of the AEPR defines air pollution as:

"when a pollutant is present in air in a quantity, way, or condition, or under a circumstance, in which:

a) *harm is likely to be caused to the environment; or*

b) *unreasonable inconvenience is likely to be caused to a person:*

   i. *at a place other than the immediate vicinity of the source of the pollutant; or*

   ii. *if the source is in a place to which members of the public have access – in that place".*

The indicators and goals which are relevant to Airport land include lead, photochemical oxidants, sulphur dioxide, total suspended particulates, nitrogen dioxide, sulphates and carbon monoxide. Schedule 1, Part 1, Table 1 of the AEPR outlines the accepted limits for air pollution by a substance derived from different sources, while Part 2, Table 2 outlines ambient air quality objectives.

Section 8 of the EAR identifies the potential air quality impacts that may occur as a result of the Project and outlines the mitigation measures to manage air quality. Air quality monitoring is recommended to be undertaken, with results being compared to the air quality objectives listed in Schedule 1 of the AEPR and other guidelines as relevant.

Surface water and groundwater quality

Section 2.02 of the AEPR defines water pollution as:

> *"when waters contain a substance or organism that causes or may cause the physical, chemical or biological condition of the waters to be adversely affected or that causes, or is reasonably likely to cause, an adverse effect on beneficial use of the waters".*

Schedule 2 of the AEPR lists the acceptable limits of various physical-chemical, nutrients, metals and biological parameters.

Section 7 of the EAR identifies the potential water quality impacts that may occur as a result of the Project and outlines the mitigation measures to manage water quality. Water quality monitoring is recommended to be undertaken, with results being compared to the water quality objectives listed in Schedule 2 of the AEPR and other guidelines as relevant.

Soils

Soil pollution is defined in Section 2.03 of the AEPR as being a substance which is likely to cause an adverse effect on the chemical or biological condition of soil or groundwater. Pollution of soil is also considered to have occurred when contamination by a substance is reasonably likely to have adverse effects on present or proposed land uses, including effects relating to odour, aesthetics, supporting human occupation and/or flora and fauna. Schedule 3 of the AEPR outlines accepted limits for soil pollution.

Section 5.5 of the EAR provides an assessment of impacts to soils, topography, geology and contamination as a result of the Project. Mitigation measures are outlined in Section 5.6 to manage these matters.

Flora and fauna

Section 4.04 of the AEPR requires the preservation of the environment by ensuring the operator of an undertaking at an airport must take all reasonable and practicable measures to ensure:

a) *"There are no adverse consequences for:*
   i. *The local biota and the ecosystems and habitats of native species*
b) *There are no adverse consequences for:*
   ii. *Flora or fauna that is known to be endangered, or vulnerable, as a species; or*
   iii. *An ecological community that is known to be an endangered ecological community"*

Section 6 of the EAR provides an assessment of the flora and fauna impacts that may occur as a result of the Project, and outlines mitigation measures to manage these potential impacts.

Cultural heritage

Section 4.04 of the AEPR requires the preservation of heritage by ensuring the operator of an undertaking at an airport must take all reasonable and practicable measures to ensure:

a) *"There are no adverse consequences for:*
   ii. *Existing aesthetic, cultural, historical, social and scientific values of the local area*
b) *There are no adverse consequences for:*
   iii. *Sites of Indigenous significance on the airport site."*

Section 4.05 states that an operator of an undertaking at an airport should give notice of cultural heritage discoveries made during an undertaking.

Section 11 of the EAR provides an assessment of the potential to encounter cultural heritage during construction of the Project. The Kingsford Smith Memorial, which contains the Southern Cross Aircraft, is located approximately 95 m from the Project site, and is potentially significant at a State or Commonwealth level for its historic significance, rarity, aesthetics, technical achievements and associative values. Mitigation measures, such as dust, noise and vibration monitoring, are proposed at the Kingsford Smith Memorial as detailed in Section 11.6.

While it is considered that impacts to cultural heritage are unlikely, the EAR identifies mitigation measures to be implemented in the event of a cultural heritage discovery.

Noise and vibration

Section 4.06 of the AEPR states that:

> *"The operator of an undertaking at an airport must take all reasonable and practicable measures:*
>
> *a) To prevent the generation of offensive noise from the undertaking; or*
>
> *b) If prevention is not reasonable or practicable – to minimise the generation of offensive noise from the undertaking".*

Equipment used within the Project site is to be operated and maintained in a proper and efficient manner to minimise noise levels (Section 4.08 of the AEPR). Section 4.09 of the AEPR states that if using operating equipment, noise control equipment fitted to or supplied with the operating equipment shall be used, otherwise the works would be in contravention of Section 4.06.

No vibration related goals are discussed in the AEPR. The Australian Standard *AS 2436-2010 Guide to noise and vibration control on construction, demolition and maintenance sites* provides guidance on noise and vibration control in respect to construction, demolition and maintenance sites and for the preparation of noise and vibration management plans, work method statements and environmental impact studies.

Section 9 provides an assessment of the potential noise and vibration impacts that could occur during construction of the Project. A range of mitigation measures have been recommended to ensure that the Project can comply with the AEPR noise limits and other vibration guidelines.

3.2.3 Airports (Protection of Airspace) Regulations 1996

3.2.3.1 Background

Certain airspace around Brisbane Airport (known as 'prescribed airspace') is protected under the *Airports (Protection of Airspace) Regulations 1996*. The prescribed airspace is made up of:

- The obstacle limitation surface (OLS) which protects aircraft operating in visual meteorological conditions
- The Procedures for Air Navigation Services Aircraft Operations (PANS-OPS) surfaces, which protect aircraft operating in instrument meteorological conditions (eg in poor weather)
- Any additional airspace that has been declared under the regulations by the Secretary of the Department of Infrastructure and Regional Development (DIRD)

As discussed in Section 3.2.1 above, the Airports Act requires a person to obtain approval from the Secretary of the DIRD to undertake controlled activities within the prescribed airspace.

3.2.3.2 Relevance to the Project

Section 13 within this EAR provides an assessment of the existing aviation safety requirements and the potential impacts due to the Project. Mitigation measures are provided to ensure that during the Project, BAC meets their duties with regards to potential impacts to aviation safety.

3.2.4 Environment Protection and Biodiversity Conservation Act 1999

3.2.4.1 Background

The EPBC Act provides that any action (ie a project, development, undertaking, activity or series of activities) which has, will have or is likely to have a significant impact on a matter of National Environmental Significance (NES), or other matter protected under the Act, such as the environment on Commonwealth land, requires approval from the Commonwealth Minister for the Environment (the Minister) through the Department of the Environment and Energy (DoEE).

Matters of NES include:

- World Heritage properties
- National Heritage properties
- Wetlands of international importance
- Listed threatened species and communities
- Listed migratory species
- Nuclear actions
- Marine environment
- Great Barrier Reef Marine Park
- Commonwealth land
- Actions taken by the Commonwealth
- Commonwealth heritage places outside of Australian jurisdiction

If the Minister decides that approval is required, the proposed action is termed a 'controlled action'. The proposal will then have to go through a formal assessment and approval process before it can proceed.

3.2.4.2 Relevance to the Project

The EPBC Act protects the environment on Commonwealth land and regulates those actions of Commonwealth departments and agencies that may have a significant impact on the environment. Therefore, BAC should have due consideration to the EPBC Act to minimise environmental impacts when working within the Project site.

A fauna and flora assessment within the Project site was undertaken by a qualified senior ecologist and an environmental scientist on 6 March 2017. No flora or fauna species or communities listed under the EPBC Act were identified during the field investigation (refer Section 6.2.2). Given the low habitat values identified, it is considered unlikely that the proposed works will impact upon listed threatened species or ecological communities under the EPBC Act.

The *Significant impact guidelines 1.1 – Matters of National Environmental Significance* (Department of the Environment 2013a) are used to determine whether the Project is likely to have a significant impact on a matter of NES under the EPBC Act. Table 3.1 outlines the relevance of each matter of NES to the Project at Brisbane Airport.

Table 3.1 Matters of national environmental significance under the EPBC Act

Aspect	Relevance to Project	Significant impact
World Heritage properties	There are no World Heritage properties situated within or in the immediate vicinity of the Brisbane Airport.	Unlikely
National Heritage places	There are no National Heritage places situated within or in the immediate vicinity of the Brisbane Airport.	Unlikely
Wetlands of international importance	The nearest Ramsar wetland of international importance is Moreton Bay, located adjacent to Brisbane Airport and approximately 5 km downstream of the Project site.	Unlikely
Listed threatened species and ecological communities	No flora or fauna species or communities listed under the EPBC Act were identified during the field investigation (refer Section 6.3.2). Given the low habitat values identified, it is considered that the proposed works will not impact upon listed threatened species or ecological communities under the EPBC Act.	Unlikely
Listed migratory species	No listed migratory species listed under the EPBC Act were identified during the field investigation (refer Section 6.3.2). Given the low habitat values identified, it is considered that the proposed works will not impact upon listed migratory species under the EPBC Act.	Unlikely

Aspect	Relevance to Project	Significant impact
The Great Barrier Reef Marine Park	Brisbane Airport does not occur within or in the immediate vicinity of the Great Barrier Reef Marine Park.	Unlikely
Nuclear action	The Project does not constitute a nuclear action.	Unlikely
Commonwealth marine areas	Brisbane Airport does not occur within or in the immediate vicinity of a Commonwealth Marine Area.	Unlikely

Given the Project is located at Brisbane Airport, which is situated on Commonwealth land, the *Significant impact guidelines 1.2 – Actions on, or impacting upon, Commonwealth land, and actions by Commonwealth agencies* (Department of the Environment 2013b) were used to determine if the Project has a significant impact on the environment. A self-assessment of works against the criteria provided in the guidelines was conducted (refer Table 3.2) (Department of the Environment 2013b).

Table 3.2 Self-assessment of significant impact of works

Self-assessment criteria	Self-assessment
Landscapes and soils *Is there a real chance or possibility that the action will:* ■ *Substantially alter natural landscape features?* ■ *Cause subsidence, instability or substantial erosion?* ■ *Involve medium or large-scale excavation or soil or minerals?*	The majority of the Project site contains casuarina plantations, which are not considered to be natural landscapes. There are natural drainage lines and wetland areas, which will be modified as a result of the Project, however these are not considered to be substantial compared with the wider Brisbane Airport. As the site is low-lying, the works will generally comprise filling activities rather than excavation. In addition, all works will be managed by an Erosion and Sediment Control Plan (ESCP) to avoid substantial erosion or sediment loss.
Coastal landscapes and processes *Is there a real chance or possibility that the action will:* ■ *Alter coastal processes, including wave action, sediment movement or accretion, or water circulation patterns* ■ *Permanently alter tidal patterns, water flows or water quality in estuaries* ■ *Reduce biological diversity or change species composition in estuaries, or* ■ *Extract large volumes of sand or substantially destabilise sand dunes?*	The works do not involve any alteration of coastal processes or the excavation of sand. Existing estuarine drainage lines will be re-aligned into a single channel along the north western boundary of the site to retain water flow and quality and to reduce the potential for flooding. An ecological investigation was conducted on 6 March 2017 by a suitably qualified Aurecon senior ecologist. No species listed under the EPBC Act and/or the *Nature Conservation Act 1992* (NC Act) were identified (refer Section 6.3.2) and as such, the Project is not expected to reduce biological diversity of Brisbane Airport.
Ocean forms, ocean processes and ocean life *Is there a real chance or possibility that the action will:* ■ *Reduce biological diversity or change species composition on reefs, seamounts or in other sensitive marine environments* ■ *Alter water circulation patterns by modification of existing landforms or the addition of artificial reefs or other large structures* ■ *Substantially damage or modify large areas of the seafloor or ocean habitat, such as sea grass* ■ *Release oil, fuel or other toxic substances into the marine environment in sufficient quantity to kill larger marine animals or alter ecosystem processes, or* ■ *Release large quantities of sewage or other waste into the marine environment?*	The works will not significantly impact ocean forms, ocean processes or ocean life as the nearest ocean is Moreton Bay, located approximately 5 km downstream. The Project will also adopt appropriate mitigation measures to minimise impacts to water quality (refer Section 7.6). In addition, as the works involve clearing and earthwork activities only, hazardous substances or waste material will not be generated in sufficient quantities and their storage and use will be managed under the Project Environmental Management Plan (EMP).

Self-assessment criteria	Self-assessment
Water resources *Is there a real chance or possibility that the action will:* ■ *Measurably reduce the quantity, quality or availability of surface or ground water* ■ *Channelise, divert or impound rivers or creeks or substantially alter drainage patterns, or* ■ *Measurably alter water table levels?*	The works will involve vegetation clearing and earthworks with potential to temporarily reduce surface water quality during construction activities. However, these impacts will be managed under an ESCP. There are two drainage lines that flow through the Project site from Landers Pocket Drain and minor drainage lines throughout. As part of the Project, these drainage lines will be realigned into a single channel along the north western boundary of the site, eventually feeding directly into the Kedron Brook Floodway Drain. As a result, the drainage patterns of the Brisbane Airport and surrounds will not be substantially altered. Surcharging activities will be managed through implementation of the EMP to avoid measurable alteration of water table levels.
Pollutant, chemicals, and toxic substances *Is there a real chance or possibility that the action will:* ■ *Generate smoke, fumes, chemicals, nutrients, or other pollutants which will substantially reduce local air quality or water quality* ■ *Result in the release, leakage, spillage, or explosion of flammable, explosive, toxic, radioactive, carcinogenic, or mutagenic substances, through use, storage, transport, or disposal* ■ *Increase atmospheric concentrations of gases which will contribute to the greenhouse effect or ozone damage, or* ■ *Substantially disturb contaminated or acid-sulphate soils?*	There is potential for contamination from minor spills or leaks of fuel or other chemicals during clearing and earthworks. This risk will be managed through the Project EMP. While the works will involve vegetation clearing and minor emissions from vehicles, it is not anticipated to substantially contribute to the greenhouse gases or ozone damage. Vegetation clearing and earthworks have the potential to generate dust, which may temporarily reduce the local air quality, however this will be managed through the Project EMP. A contaminated land investigation was conducted across the Project site and detected minor concentrations of heavy metals and per- and poly-fluoroalkyl substances (PFAS) widespread across the site. These concentrations were below relevant screening criteria and can be managed under the Project EMP (refer Section 5.4.4). Both actual and potential ASS were detected across the Project site and will be managed during construction through the implementation of an ASS Management Plan.
Plants *Is there a real chance or possibility that the action will:* ■ *Involve medium or large-scale native vegetation clearance* ■ *Involve any clearance of any vegetation containing a listed threatened species which is likely to:* – *Result in a long-term decline in a population or which threatens the viability of the species* – *Introduce potentially invasive species* – *Involve the use of chemicals which substantially stunt the growth of native vegetation, or* – *Involve large-scale controlled burning or any controlled burning in sensitive areas, including areas which contain listed threatened species?*	The Project will involve approximately 55.9 ha of vegetation clearance of predominately casuarina plantations with some mangrove communities. This comprises approximately 3.5% of the total vegetation within Brisbane Airport. An ecological investigation was conducted on 6 March 2017 by a suitably qualified Aurecon senior ecologist. No conservation significant species listed under the EPBC Act and/or the NC Act were identified (refer Section 6.3.2). There is potential for weed species to be introduced by construction vehicles, machinery and/or personnel, however this will be managed under the Project EMP. The works will not involve the use of chemicals or controlled burning for the control/clearing of vegetation.

Self-assessment criteria	Self-assessment
Animals *Is there a real chance or possibility that the action will:* ■ *Cause a long-term decrease in, or threaten the viability of, a native animal population or populations, through death, injury or other harm to individuals* ■ *Displace or substantially limit the movement or dispersal of native animal populations* ■ *Substantially reduce or fragment available habitat for native species;* ■ *Reduce or fragment available habitat for listed threatened species which is likely to displace a population, result in a long-term decline in a population, or threaten the viability of the species* ■ *Introduce exotic species which will substantially reduce habitat or resources for native species, or* ■ *Undertake large-scale controlled burning or any controlled burning in areas containing listed threatened species?*	An ecological investigation was conducted on 6 March 2017 by a suitably qualified Aurecon senior ecologist. No conservation significant species listed under the EPBC Act and/or the NC Act were identified (refer Section 6.3.2). The Project site is bound by Airport Drive, Moreton Drive and Nancy Bird Way and as such, when considering ecological function, is already significantly fragmented. In addition, the majority of the site contains casuarina plantations, which are not considered to provide substantial habitat for native fauna populations. The works will not involve the introduction of exotic species or use controlled burning for vegetation clearing.
Impacts on people and communities *Is there a real chance or possibility that the action will:* ■ *Substantially increase demand for, or reduce the availability of, community services or infrastructure which have direct or indirect impacts on the environment, including water supply, power supply, roads, waste disposal, and housing* ■ *Affect the health, safety, welfare or quality of life of the members of a community, through factors such as noise, odours, fumes, smoke, or other pollutants* ■ *Cause physical dislocation of individuals or communities, or* ■ *Substantially change or diminish cultural identity, social organisation or community resources?*	A traffic assessment will be conducted as part of the Project. However, given traffic associated with the Project will be temporary in nature during the construction phase, traffic volumes generated by the Project will not constitute a significant impact (refer Section 13.4). The Project site is situated in the Brisbane Airport with predominately industrial activities located nearby. Sensitive receptors to the Project are discussed in Section 8. Impacts such as noise, odours, fumes, smoke or dust will not impact the local community. There will be no dislocation of individuals or communities as part of the Project. There is no change to cultural identify, social organisation or community resources as the Project is situated in the Airport Central (Airport Drive West) area and is zoned as Mixed Use under the Brisbane Airport Master Plan 2014.

Self-assessment criteria	Self-assessment
Heritage *Is there a real chance or possibility that the action will:* ■ *Permanently destroy, remove or substantially alter the fabric (physical material including structural elements and other components, fixtures, contents, and objects) of a heritage place* ■ *Involve extension, renovation, or substantial alteration of a heritage place in a manner which is inconsistent with the heritage values of the place* ■ *Involve the erection of buildings or other structures adjacent to, or within important sight lines of, a heritage place which are inconsistent with the heritage values of the place* ■ *Substantially diminish the heritage value of a heritage place for a community or group for which it is significant* ■ *Substantially alter the setting of a heritage place in a manner which is inconsistent with the heritage values of the place, or* ■ *Substantially restrict or inhibit the existing use of a heritage place as a cultural or ceremonial site?*	One item with historic heritage significance has been identified within the vicinity of the Project site; the Kingsford Smith Memorial). However, no direct impacts are expected to occur to the Kingsford Smith Memorial (refer Section 11.5). The Project is located 95 m from the Kingsford Smith Memorial and it is understood that a buffer of vegetation will remain between the Kingsford Smith Memorial and the proposed development, which will provide a visual barrier. The amenity, use and setting of the Kingsford Smith Memorial will not significantly change as a result of the proposed development. Mitigation measures to be implemented for the protection of heritage, including incidental finds, are provided in Section 11.6. The existing Heritage Management Plan will be used to manage Aboriginal Cultural Heritage matters throughout Project activities.

Given the results of the self-assessments, the Project does not need to be referred to the DoEE.

3.2.5 National Environment Protection Council Act 1994

3.2.5.1 Background

The *National Environment Protection Council Act 1994* (NEPC Act) provides for the establishment of a National Environment Protection Council (NEPC) and that the Commonwealth, the States and territories will make joint legislative provision for the establishment of a body to determine national environment protection measures for air, water, soil and noise pollution.

National Environment Protection (Ambient Air Quality) Measure (Air NEPM)

National ambient air quality standards were set for carbon monoxide, ozone, sulphur dioxide, nitrogen dioxide, lead and particles under the Air NEPM. To comply with the requirements of the Air NEPM and the NEPC Act, the Queensland Department of Environment and Heritage Protection (EHP) have established a number of monitoring stations in Queensland to determine whether any exceedances of the national ambient air quality standards occur.

National Environment Protection (Air Toxics) Measure (Air Toxics NEPM)

In 2004, the NEPC developed the Air Toxics NEPM to provide a framework for monitoring, assessing and reporting on ambient levels of five air toxins including benzene, formaldehyde, benzo(a)pyrene as a marker for polycyclic aromatic hydrocarbons, toluene and xylenes. Schedule 3 of the Air Toxics NEPM outlines the monitoring investigation levels for these air toxins.

National Environment Protection (Assessment of Site Contamination) Measure 1999 (Amendment 1, 2013) (NEPM 2013)

NEPM 2013 establishes a nationally consistent approach to the assessment of site contamination to ensure sound environmental management practices are adopted. Schedule A identifies the recommended process for the assessment of site contamination, while Schedule B provides general guidelines, such as the use of investigation levels for soil and groundwater, to assess site contamination.

3.2.5.2 Relevance to the Project

Air quality standards are discussed and addressed in further detail in Section 8. The section also provides an assessment of the existing air environment and potential impacts from the Project. Mitigation measures are provided to ensure that during the Project, BAC will meet their duties with regards to managing air quality during the Project in accordance with the relevant air quality standards.

Further discussion regarding contamination in relation to the Project site and the applicability of the NEPM 2013 is outlined in Section 5.4.4. The section also provides an assessment of the existing contamination within the Project site and the potential impacts to the Project. Mitigation measures are provided to ensure that during the Project, BAC meets their duties with regards to the NEPM 2013.

3.3 Pre-existing Airport Land

3.3.1 General

Relevant airport policy and planning documents applicable to this Project include:

- Brisbane Airport Master Plan
- Airport lease
- Brisbane Airport Environment Strategy
- Brisbane Airport Development Control Document
- Airport Technical Guidelines

The relevance of these policy and planning documents is assessed below.

3.3.2 Brisbane Airport Master Plan

3.3.2.1 Background

The BAC Master Plan (BAC 2014b) sets out the vision for current and future airport land use and the development plan over the next 20 years. Under the Airports Act, BAC is required to review its Master Plan every five years. The Australian Government approved Brisbane Airport's 2014 Master Plan on 13 January 2015.

BAC's vision for Brisbane Airport is to be world class – a distinctive place that visitors keep coming back to, and the best possible partner for airlines and businesses (BAC 2014b).

3.3.2.2 Assessment process

The Master Plan sets out the land use planning and development intent on the airport site. Before BAC grants consent for any intended land use, it must have regard to the purpose outcomes of the relevant zoning, the overall outcome for the precinct or sub-precinct and the Master Plan's development objectives. The results of BAC's assessment are then passed onto the Airport Building Controller (ABC) and AEO for building approval. This is discussed further in Section 3.3.5.

3.3.2.3 Master Plan precincts

The 2014 Master Plan has consolidated development land into five sub-precincts (and nine distinct sub-precincts), which are intended to create and maintain clusters of businesses and operations to generate a sense of identity and community:

1. Airport South (Airport Industrial Park, Da Vinci and Export Park)
2. Airport East
3. Airport Central (Skygate, Airport Drive West, Domestic T2, International T1 and Moreton Drive West)

4. Airport West (Central Parking Area)
5. Airport North

In addition, a separate conservation area known as the Biodiversity Zone, accounts for Brisbane Airport's protection of high value environmental lands.

In each precinct, BAC has nominated land use zonings along with zoning statements, zoning outcomes and intended uses, with all developments subject to BAC's consent (BAC 2014b).

Some developments trigger the requirement for an MDP under the Airports Act before a building approval can be issued and a construction activity can commence. An MDP must be consistent with the approved Master Plan. Section 89 of the Airports Act prescribes those activities that require an MDP as 'major airport development'. Under the Act, the Project may trigger the following:

(e) Constructing a new building, where:

(i) the building is not wholly or principally for use as a passenger terminal; and

(ii) the cost of construction exceeds $20 million or such higher amount as is prescribed; or

(m) A development of a kind that is likely to have significant environmental or ecological impact; or

(n) A development which affects an area identified as environmentally significant in the environment strategy; or

(na) A development of a kind that is likely to have a significant impact on the local or regional community

3.3.2.4 Relevance to the Project

The Project site is located in the Airport Central (Airport Drive West) sub-precinct, and is zoned by BAC as "Mixed use". It is considered that the Project is consistent with intended uses under the 'Mixed use' zoning for the Project site. Further discussion on zoning and land use for the Project site is provided in Section 4 of this EAR.

The Project will not have a significant environmental or ecological impact as long as mitigation measures recommended in this EAR are implemented. In addition, the associated construction for the Project will be below $20 million in value. Therefore, an MDP does not need to be prepared. This is further discussed in Section 3.2.1.2.

This EAR provides an assessment of the bulk earthworks and site preparation component of the Project only and does not assess future intended uses within the Project site. Assessment of the future use of the Project site will be undertaken separately to ensure compliance with the Airports Act.

3.3.3 Airport lease

3.3.3.1 Background

BAC purchased the long-term lease (50 + 49 years) of Brisbane Airport from the Commonwealth and took over management and operations on 2 July 1997. The planning and development of Brisbane Airport is regulated by the DIRD under the Airports Act.

When BAC became the airport-lessee company for Brisbane Airport in July 1997, it assumed certain pre-existing lessor obligations under various leases. BAC also became the head-lessee under the airport lease subject to a number of other interests in the airport land (such as easements).

3.3.3.2 Relevance to the Project

Given that the Project is compliant with the intent of the BAC Master Plan, the Project is considered to fully comply with the requirements of the Airport lease. There are no known contractual or other rights affecting the Project site, which would constrain the development of the Project, with the exception of the Energex Lease EGXA on SP232747 for 110 kV cables and a permit for 33 kV cable installations.

3.3.4 Brisbane Airport Environmental Strategy (AES)

3.3.4.1 Background

The AES (BAC 2014a) is the formal blueprint of BAC's commitment to world best practice environmental sustainability. The AES outlines a framework for environmental management at Brisbane Airport and responds to the requirements of the Airports Act and AEPR. The AES now forms part of the Master Plan.

The 2014 AES was prepared in accordance with the Airports Act and AEPR. It covers a wide range of issues including environmentally significant areas (ESAs), sources of environmental impact and environmental management. The environment and sustainability policy is seen as the foundation of the Environmental Management System (EMS) and AES and guides the implementation of both. The policy represents a formal undertaking by BAC to give due consideration to the potential environmental impacts of all aspects of BAC's activities and operations.

The AES covers all environmental matters arising from the operation and expansion at the Brisbane Airport site in accordance with the Airport Legislation. Each of the sections detailed in the AES are in direct response to the specific requirements listed in the Airport Legislation. The AES does not cover noise and air pollution from aircraft movements, which is regulated under separate legislation, the Commonwealth *Air Navigation (Aircraft Engine Emissions) Regulations* and *Air Navigation (Aircraft Noise) Regulations*.

The AES adopts relevant legislation that is applicable to environmental regulation or activities on airport (whether Commonwealth or State) where reasonable and practicable. The AES also identifies areas as ESAs.

3.3.4.2 Relevance to the Project

This EAR provides an assessment of the potential environmental impacts that may occur as a result of the Project and therefore complies with BAC's overall environmental policy as outlined within the AES.

The Project site is not located within an ESA, nor does it impact on an ESA.

3.3.5 Airport development and building approvals

3.3.5.1 Background

All building and development works are subject to internal assessment which begins with BAC initially checking the proposed development for consistency and compliance with the development intent outlined in a range of documents including:

- The approved Master Plan
- The approved AES
- BAC's relevant Airport Precinct Plan and associated Development Control Documents
- BAC's Airport Technical Guidelines

Once the development has been evaluated against BAC's assessment criteria, the on site Australian Government representatives, the ABC and the AEO, undertake the regulatory assessment requirements that include consideration of planning, building and environment issues.

Building approvals are issued by the ABC, who is appointed by the DIRD. The AEO (employed by the DIRD) recommends to the ABC the conditions to be placed on approval for environmental management. Building approval is required for new buildings and structures (including runways, taxiways and aprons), earthworks, demolition, electrical and hydraulic works. The ABC assesses the proposal's design and compliance with the Australian Building Standards.

Building approvals cannot be issued by the ABC without written consent from BAC, confirming that the development is consistent with the development intent for the precinct.

3.3.5.2 Relevance to the Project

Master Plan and Airport Environment Strategy

Sections 3.3.2 and 3.3.4 summarise the consistency of the Project with the Master Plan and AES respectively.

Airport Precinct Plan and Development Control Documents

BAC has developed individual Precinct Plans that are consistent with the BAC Master Plan. Each Precinct Plan is guided by the Master Plan's development objectives, zoning and airport precinct overall outcomes to meet infrastructure demand, manage growth and facilitate business generation for the airport and region over the next 20 years. The Development Control Document (DCD) implements the Precinct Plan on the ground.

The DCD provides minimum development guidelines to be adopted when designing buildings and sites within the Airport Precincts. The DCD sets out performance criteria and associated controls to achieve the performance criteria.

The majority of the DCD focuses on the development guidelines to be adopted in the design of buildings and sites within the Airport Precincts. The assessment of buildings is outside of the scope of this EAR. However, where the DCD provides construction-related guidance, an assessment of the Project's compliance with the DCD has been undertaken in Table 1 in Appendix B.

For matters addressing detailed design of the Project, it has been assumed that the requirements are the responsibility of the Designer and/or Contractor to comply with. The Designer and Contractor will need to review their works to ensure compliance with the DCD.

Airport Technical Guidelines

The Airport Technical Guidelines were prepared by BAC to assist designers, contractors and other specialists involved in preparing design and contract documentation for works on Brisbane Airport. The Airport Technical Guidelines present a number of planning phase requirements to be considered.

The planning phase requirements outlined in the Airport Technical Guidelines have been reviewed as part of this EAR and the Project is consistent with these guidelines where relevant (refer Table 2 in Appendix B).

During the next phase of the Project, the Designer and Contractor will need to review their works to ensure compliance with the Airport Technical Guidelines.

Register of building applications

Section 4 provides a review of BAC's register of building applications to determine whether any current building applications and approvals are applicable to land within close proximity to the Project site.

3.4 Consistency with State and Local Government Planning

While the environment is principally administered by Commonwealth legislation when on airport land, State legislation may be applicable in certain circumstances where no Commonwealth legislation exists or where State legislation can operate concurrently. The BAC 2014 AES refers to State legislation and guidelines where required.

BAC is required by the Master Plan and Airports Act (and associated regulations) to address the extent, if any, of consistency with relevant State planning instruments. BAC is committed to consultative processes with relevant State Government agencies and the Brisbane City Council (BCC) regarding the strategic planning of key infrastructure. Accordingly, BAC seeks to ensure that development at Brisbane Airport, where possible, is compatible with State planning strategies (BAC 2014b). This section evaluates the consistency of the Project with State legislation that would apply if the Project was not under the jurisdiction of the Commonwealth.

The following legislation is considered to be relevant to the Project for environmental management purposes and is assessed below:

- *Environmental Protection Act 1994*
- *Aboriginal Cultural Heritage Act 2003*
- *Queensland Heritage Act 1992*
- *Fisheries Act 1994*
- *Biosecurity Act 2014*
- *Nature Conservation Act 1992*
- *Water Act 2000*

3.4.1 Environmental Protection Act 1994

3.4.1.1 Background

The *Environmental Protection Act 1994* (EP Act) and the *Environmental Protection Regulation 2008* (EP Reg) provide a framework for managing Queensland's environment within the principles of ecologically sustainable development.

A key feature of the EP Act is the consideration of a general environmental duty. Individuals undertaking any activity must take all reasonable and practical measures to prevent or minimise environmental harm.

Prescribed ERAs

The EP Act, together with the *Planning Act 2016*, provides a licensing and approval regime for a range of prescribed environmentally relevant activities (ERAs), which are activities with the potential to cause environmental harm through the release of contaminants. Prescribed ERAs are defined under Schedule 2 of the EP Reg. To conduct a prescribed ERA, an environmental authority is required. If the prescribed ERA is also listed as a concurrence activity, a development approval is also required. Codes of environmental compliance can be used to carry out certain ERAs in accordance with well established, standard practices.

Environmental Protection Policies

The EP Act outlines the responsibility and the duty of care all persons have to the environment and the scope and content for preparing environmental protection policies (EPPs). EPPs identify particular environmental values to be enhanced or protected and generally state the objectives to be achieved and maintained.

Disposal of contaminated soil from land

Section 424 of the EP Act contains requirements for the lawful disposal of contaminated soil, including asbestos containing material (ACM). A person proposing to remove and dispose of contaminated soil from land which is recorded on either the Environmental Management Register (EMR) or the Contaminated Land Register (CLR) to an off-site location must obtain a disposal permit from EHP in order to lawfully undertake the works. Disposal permits enable appropriate and legal disposal and tracking of contaminated soil or materials.

3.4.1.2 Relevance to the Project

The Project does not need to comply with the requirements of the EP Act. However, the Project can still demonstrate that it complies with the intent of the EP Act (ie the general environmental duty) as BAC will undertake Project activities in accordance with the measures recommended in this EAR, and as listed in the Environmental Management Plan (EMP) to be prepared for the Project.

Environmentally relevant activities (ERAs)

The Project will consist of screening and rock crushing activities. These activities are listed as ERAs under the EP Act. Screening activities are covered by ERA 16, while crushing activities are covered by ERA 33. Eligibility criteria and standard conditions have been developed for ERA 16, but not for ERA 33.

While BAC is not required to comply with the *Eligibility criteria and standards conditions for screening (more than 100,000 tonnes but not more than 1 million tonnes of material in a year) (ERA 16)* when

undertaking activities covered by ERA 16, the criteria provide guidance on good practice management to ensure environmental risks associated with the operation of an ERA are able to be managed with standard conditions.

Eligibility criteria relate to the following matters:

- Activity size (ie how much material will be screened)
- Activity location relative to sensitive receptors
- The volume of fuel used
- The release of aqueous waste from the activity to water

The standard conditions for the Eligibility Criteria (ERA 16) (and the sections of the EAR that address these issues) are:

- Identifying environmental risks for the Project (throughout the EAR)
- Establishing control measures that minimise the potential for environmental harm (throughout the EAR)
- Ensuring plant and equipment is maintained (refer Sections 8 and 9)
- Air quality (refer Section 8)
- Fuels and chemicals (refer Section 12)
- Noise and vibration (refer Section 9)
- Land including contamination and ASS (refer Section 5)
- Water (refer Section 7)
- Waste (refer Section 12)

No eligibility criteria or standard conditions have been developed for ERA 33 (crushing, milling, grinding or screening). Notwithstanding, should the Project adopt the management measures outlined within this EAR, it is considered that the risks associated with undertaking the crushing and screening activities can be appropriately managed.

Environment Protection Policies (EPPs)

EPPs cover air, noise and water through the following policies:

- *Environmental Protection (Air) Policy 2008* (EPP (Air))
- *Environmental Protection (Water) Policy 2009* (EPP (Water))
- *Environmental Protection (Noise) Policy 2008* (EPP (Noise))

With regards to air quality, water quality and noise, there are both Commonwealth and State requirements. BAC believes that it is more appropriate to adopt the Commonwealth requirements, rather than State requirements, except in instances where the Commonwealth legislation is silent on certain aspects.

In relation to air quality, the AEPR, Air NEPM, Air Toxics NEPM and the EPP (Air) do not provide dust deposition levels. However, it is noted that EHP published the *Guideline: Application requirements for activities with impacts to air* (EHP 2014) that recommends assessment of dust nuisance against a dust deposition limit value of 120 mg/m^2/day averaged over a month. According to AS/NZS 3580.10.1:2003, dust deposition monitoring results should be normalised to a 30-day month, meaning that the 120 mg/m^2/day equates to 3.6 g/m^2/month. Accordingly, this dust deposition limit can be applied to this Project (refer Section 8).

For water quality, the AEPR criteria are the most applicable to the Project. Accordingly, the AEPR is used for this Project to characterise the receiving waters, rather than the EPP (Water) (refer Section 7).

In relation to noise, the AEPR construction noise criteria have been adopted for the Project rather than the criteria listed in the EPP (Noise) (refer Section 9).

3.4.2 Aboriginal Cultural Heritage Act 2003 and Queensland Heritage Act 1992

3.4.2.1 Background

The *Aboriginal Cultural Heritage Act 2003* (ACH Act) requires all persons undertaking an activity to "take all reasonable and practicable measures to ensure the activity does not harm Aboriginal cultural heritage (the 'cultural heritage duty of care')".

The *Queensland Heritage Act* 1992 (QH Act) provides for the conservation of Queensland's historical cultural heritage, including places, trees, natural formations and buildings of cultural heritage significance.

3.4.2.2 Relevance to the Project

To comply with the duty of care under the ACH Act, mitigation measures will need to be included in the EMP.

Section 11 within this report provides an assessment of the existing environment for cultural heritage and potential impacts from the Project. Mitigation measures are then provided to ensure that during the Project, BAC meets their duties with respect to the 'cultural heritage duty of care' under the ACH Act and QH Act.

3.4.3 Fisheries Act 1994

3.4.3.1 Background

The *Fisheries Act 1994* (Fisheries Act) provides for the management, use, development and protection of fisheries resources and fish habitats, and the management of aquaculture activities. The Act holds provisions for:

- Removal, destruction and/or damage to marine plants, including mangroves
- Works in a declared fish habitat
- Waterway barrier works

3.4.3.2 Relevance to the Project

Outside of Brisbane Airport, works for the above activities would be assessable development according to Schedule 7, Part 3, Sections 6 – 8 of the *Planning Regulation 2017*. Self-assessable codes may be used for low-impact development involving disturbance to marine fish habitats and water barriers. However, given State legislation does not apply to the Project, a development approval will not need to be sought for these activities. BAC, wherever possible, may seek to comply with policy intents of the relevant fisheries codes.

It should be noted that BAC has a designated offset area of 285 ha, which equates to approximately 10% of airport land. This area allows for offsetting for previously cleared areas, as well as for future clearing activities, such as the Project subject to this EAR.

The ecological survey undertaken for the Project involved identifying the vegetation communities located within the Project site (refer Section 6). Two vegetation communities were identified within the Project site that constitute marine areas under the provisions of the Fisheries Act, including:

- Mangrove (*Avicennia marina*) tidal community
- Marine wetland with mangroves

Mitigation measures are provided to ensure that during the Project, BAC meets their duties with regards to the management of flora and fauna within the Project site.

3.4.4 Biosecurity Act 2014

3.4.4.1 Background

The purpose of the *Biosecurity Act 2014* is to provide measures to safeguard the economy, agriculture and tourism industries and environment from:

- Weed and pest species
- Diseases
- Contaminants

Under the Act, individuals and organisations (eg landholders, developers etc) whose activities pose a biosecurity risk have a general biosecurity obligation meaning they must:

- Take all reasonable and practical steps to prevent or minimise a biosecurity risk
- Minimise the likelihood of causing a biosecurity event and limit the consequences of such an event
- Prevent or minimise the adverse effects the risk could have and refrain from doing anything that might exacerbate the adverse effects

A biosecurity event is caused by a weed/pest, disease or contaminant that is or is likely to cause a significant impact on human health, social amenity, the economy or the environment.

Schedules 1 and 2 of the Act lists prohibited matter and restricted matter respectively, which are detailed in Table 3.3.

Table 3.3 Prohibited and restricted matter under the *Biosecurity Act 2014*

Biosecurity matter	Description	Actions required
Prohibited matter	Prohibited matter is biosecurity matter that is not found in Queensland but would have a significant adverse impact if it entered the State.	If prohibited matter is present, the following actions must be taken: ■ Report to Biosecurity Queensland within 24 hours ■ Minimise the risk of the prohibited matter
Restricted matter	Restricted matter is biosecurity matter that is already present in Queensland but requires specific actions to control the spread and impact. There are seven categories of restricted matter.	Categories 1 and 2 restricted matter must be reported to an inspector within 24 hours. Category 3 restricted matter must not be given as a gift, sold, traded or released into the environment unless under a Restricted Matter Permit. Category 4 restricted matter must not be moved this restricted matter to ensure that it does not spread into other areas of the state. Category 5 restricted matter must not be kept or possessed unless under a permit of the *Biosecurity Act 2014* or another Act. Category 6 restricted matter must not be fed as feeding this restricted matter may cause their numbers to increase and negatively impact the economy or the environment. Category 7 restricted matter includes noxious fish that must be killed and disposed appropriately.

Source: Department of Agriculture and Fisheries 2016a

3.4.4.2 Relevance to the Project

The ecological survey undertaken for the Project site assessed the presence of weeds and pests and identified their classifications according to the *Biosecurity Act 2014* (refer Section 6). Eight flora species were identified as Schedule 2 plants under the *Biosecurity Act 2014*. These weed species consisted of the following:

- *Ambrosia artemisiifolia*
- *Asparagus aethiopicu*
- *Celtis sinensis*
- *Dolichandra unguis-cati*

- *Asparagus plumosus*
- *Baccharis halimifolia*
- *Lantana camara*
- *Schinus terebinthifolius*

Section 6 assesses the potential impacts to the Project due to weeds and pests and recommends mitigation measures to ensure that during the Project, BAC can manage declared weeds and pests within the Project site in accordance with the *Biosecurity Act 2014*.

3.4.5 Nature Conservation Act 1992

3.4.5.1 Background

The *Nature Conservation Act 1992* (NC Act) provides a comprehensive strategy for the conservation and management of Queensland's native animals and plants. Sections 88 and 89 of the NC Act make it an offence for a person to 'take' a listed species without a licence, permit, authorisation granted under a regulation, an exemption under a regulation or under a conservation plan applicable to the species. The *Nature Conservation Regulation 2006* (NC Reg) applies to the clearing of protected plants in the wild. All native plants in Queensland are protected plants.

Wildlife (animals and plants) can be declared under the Act within the following classes:

- Extinct in the wild wildlife
- Endangered wildlife
- Vulnerable wildlife
- Near threatened wildlife
- Least concern wildlife
- International wildlife
- Prohibited wildlife

3.4.5.2 Relevance to the Project

Section 6 of this EAR provides an assessment of the existing flora and fauna within the Project site and identifies potential impacts from the Project. Mitigation measures are then provided to ensure that during the Project, BAC meets their duties with regards to the management of flora and fauna within the Project site and are consistent with the requirements of the NC Act.

The Protected Plants Flora Survey Trigger Map (refer Appendix C) indicates that the Project site is not located within a high risk area and as such, provisions of the NC Act do not apply to the clearing of protected plants.

The ecological survey undertaken for the Project involved identifying the flora and fauna species located within the Project site (refer Section 6). The classification of these species under the NC Act was also identified. No conservation significant flora species were identified during the ecological survey. Fourteen bird species and one reptile were recorded during the survey, all of which were least concern species under the NC Act, with the exception of one species (ie Rainbow Bee-eater *Merops ornatus*), which is listed as Marine.

3.4.6 Water Act 2000

3.4.6.1 Background

The *Water Act 2000* (Water Act) provides a legislative base for the sustainable planning of Queensland's non tidal waters. The Water Act requires the preparation of a Water Resource Plan, and when necessary, resource operation plans, which ensure that water is equitably managed to preserve the existing quality of life and aquatic ecosystems.

A Water Resource Plan details what the government aims to achieve for a catchments social, economic and environmental needs. The *Water Resource (Moreton) Plan 2007* covers the location of the Project site.

3.4.6.2 Relevance to the Project

The following ecological outcomes of the plan are relevant to the management of the Project site:

- For estuarine reaches, to minimise changes to brackish water habitats

- For Moreton Bay and Pumicestone Channel, to minimise changes to the natural movement and delivery of sediment, and the delivery of fresh water, natural nutrients and organic matter

Water quality monitoring and management should be undertaken in accordance with relevant guides such as BAC's *Landside Stormwater Quality Management Strategy* (BAC 2014c) and BAC's *Construction Environmental Management Plan (CEMP) Guidelines* (BAC 2014d) during construction of the Project to ensure that water discharging from the Project site does not adversely impact on the ecological outcomes for Moreton Bay.

3.5 State planning provisions

The following state planning provisions have been assessed in relation to the Project:

- ShapingSEQ
- State Planning Policy

3.5.1 ShapingSEQ

3.5.1.1 Background

ShapingSEQ is the draft statutory South East Queensland regional plan (Department of Infrastructure, Local Government and Planning 2016). ShapingSEQ allocates all land in the SEQ region into one of the following regional land use categories:

a) Regional Landscape and Rural Production Area

b) Urban Footprint

c) Rural Living Area

Brisbane Airport is mapped within the Urban Footprint. ShapingSEQ recognises the Australia TradeCoast, which includes the Port of Brisbane and Brisbane Airport, as one of the essential drivers of the SEQ region's economic growth and a significant employment generator.

3.5.1.2 Relevance to the Project

While ShapingSEQ recognises the importance of Brisbane Airport in the development of the South East Queensland region, ShapingSEQ does not regulate development activities on Brisbane Airport land.

BAC's development objectives and land use planning outcomes for Brisbane Airport, as outlined in the BAC Master Plan, are consistent with ShapingSEQ's planning outcomes. It is envisaged that the Project will enable further economic development within the Airport Central (Airport Drive West) sub precinct.

3.5.2 State Planning Policy

3.5.2.1 Background

The State Planning Policy (SPP) defines the Queensland Government's approach to matters of state interest in land use planning and development. The SPP identifies the state's interests in planning and development and how they must be dealt with in planning schemes, council development assessment processes and in designating land for infrastructure (Department of Infrastructure, Local Government and Planning 2017).

The SPP, effective 3 July 2017, identifies 17 state interests across five broad themes as follows:

- Liveable communities and housing
- Economic growth
- Environment and heritage
- Safety and resilience to hazards

- Infrastructure

The SPP applies, to the extent relevant, when:

1. Making or amending a local planning instrument
2. Making or amending a regional plan
3. Designating premises for infrastructure
4. Local government is assessing a development application, if its planning scheme has not yet appropriately integrated he relevant SPP state interest policies
5. An assessment manager or referral agency other than local government is assessing a development application.

In relation to the Project, an assessment of the Project's compliance with the state interest policies and assessment benchmarks as outlined in Part E of the SPP has been undertaken in Table 3.4.

3.5.2.2 Relevance to the Project

BAC seeks to ensure that Brisbane Airport development, where possible, is compatible with State planning provisions. An assessment of the Project's compliance with the SPP in relation to matters of State interest is provided in Table 3.4 below. The matters listed in Table 3.4 are those matters that were triggered by the SPP mapping or other Queensland Government mapping for the Project site.

Table 3.4 Compliance against relevant matters of State interest under the SPP

Matter of State Interest triggered under the SPP mapping within the Project site	Mitigation measure	Project compliance with State interest requirement
State interest – biodiversity		
1) Development is located in areas to avoid significant impacts on matters of national environmental significance and considers the requirements of the *Environment Protection and Biodiversity Conservation Act 1999.* 2) Matters of state environmental significance are identified and development is located in areas that avoid adverse impacts; where adverse impacts cannot be reasonably avoided, they are minimised. 3) Matters of local environmental significance are identified and development is located in areas that avoid adverse impacts; where adverse impacts cannot be reasonably avoided, they are minimised. 4) Ecological processes and connectivity is maintained or enhanced by avoiding fragmentation of matters of environmental significance 5) Viable koala populations in South East Queensland are protected by conserving and enhancing koala habitat extent and condition.	The SPP mapping identifies "*regulated vegetation (intersecting a watercourse)*", *"regulated vegetation",* "*Matter of State Environmental Significance (MSES) - High Ecological Significance wetlands*" and *"MSES – Wildlife habitat"* within the Project site. However, the area in which the Project is to be located is highly modified with existing and future development proposed as part of the Brisbane Airport 2014 Master Plan. Appropriate environmental mitigation measures will be implemented to reduce any potential negative impacts on the receiving environment, as discussed throughout this EAR.	Achieved

Matter of State Interest triggered under the SPP mapping within the Project site	Mitigation measure	Project compliance with State interest requirement
State interest – water quality		
The following requirements are assessment benchmarks for the development: 1) Development is located, designed, constructed and operated to avoid or minimise adverse impacts on environmental values arising from: a) altered stormwater quality and hydrology b) wastewater c) the creation or expansion of non-tidal artificial waterways d) the release and mobilisation of nutrients and sediments. 2) Development achieves the applicable stormwater management design objectives outlined in tables A and B (appendix 2) 3) Development in a water supply buffer area avoids adverse impacts on drinking water supply environmental values.	Section 7 provides an assessment of the Project in relation to the environmental values of receiving waters, in particular an assessment of the potential impacts to stormwater quality and flow. While an assessment of the Project against the SPP Code: Water Quality is not strictly necessary, the performance outcomes and acceptable outcomes of the Code provide guidance on best practice environmental management for the Project. The following guidance should be considered for the Project: ■ Planning to avoid/minimise new impacts, such as: – Preparation of stormwater quality management measures for the site that is consistent with any existing stormwater management planning for the area, and meeting appropriate design objectives – Wastewater (including septic waste and contaminated stormwater captured within spill containment bunds) is to be managed through the implementation of a waste management plan during construction (refer Section 12) ■ Construction to avoid/minimise new impacts: – Preparation of an ESCP	Achieved
	■ Operate to avoid/minimise impacts: – Development incorporates stormwater flow control measures to achieve design objectives outlined in the SPP Code, or current best practice environmental management, including management of frequent flows, peak flows, and construction phase hydrological impacts using Water Sensitive Urban Design (WSUD) treatments – Manages wastewater discharges to non-tidal artificial waterways ■ Avoids lowering groundwater levels where potential and actual ASS are present	

Matter of State Interest triggered under the SPP mapping within the Project site	Mitigation measure	Project compliance with State interest requirement
State interest – natural hazards		
Development: 1) Development avoids natural hazard areas, or where it is not possible to avoid the natural hazard area, development mitigates the risks to people and property to an acceptable or tolerable level.	The Project site is located within a mapped bushfire hazard area – "*High Potential Bushfire Intensity*". However, the Project site will be cleared of vegetation upon commencement of Project works, thereby removing the risk from bushfires. The Project site is also located in a high and medium storm tide coastal hazard area, and an erosion prone area. Appropriate mitigation measures will need to be adopted to address erosion and sediment control as described in Section 5. Flood immunity of the Project site will be achieved through protection by the higher levels of the enclosing road embankments of Moreton Drive, Nancy Bird Way and Airport Drive. To achieve 1:100 year flood immunity, the Airport Drive median would need to be raised by up to 200 mm in some areas through landscaping. These road systems combined with potential flap gates installed on a number of major culvert crossings will prevent backwater from regional flood events and storm surge/tidal events entering the Project site.	Achieved
2) Development supports and does not hinder disaster management response or recovery capacity and capabilities.	The road access network around the Project site provides efficient access to surrounding areas. The Project site will not inhibit disaster management response or recovery capacity and capabilities.	Achieved
3) Development directly, indirectly and cumulatively avoids an increase in the severity of the natural hazard and the potential for damage on the site to other properties.	Previous development on the majority of nearby lots has involved extensive clearing, thereby significantly reducing the risk of bushfire hazards. The Project site will also be cleared of vegetation and is bounded by major roads, which will act as a firebreak in the event of a bushfire.	Achieved
4) Risks to public safety and the environment from the location of hazardous materials and the release of these materials as a result of a natural hazard are avoided.	During construction, hazardous material will be contained within appropriately sized bunds in accordance with AS1940.	Achieved
5) Natural processes and the protective function of landforms and the vegetation that can mitigate risks associated with the natural hazard are maintained or enhanced.	Flap/tidal gates may be installed at the major culverts into the Project site to prevent impacts from storm or tidal surges or regional flooding. A perimeter drain will be installed in accordance with the recommended mitigation measures in this EAR.	Achieved

Matter of State Interest triggered under the SPP mapping within the Project site	Mitigation measure	Project compliance with State interest requirement
State interest – strategic airports and aviation facilities		
1) Development and associated activities do not create a permanent or temporary physical or transient intrusion into a strategic airport's operational airspace, unless the intrusion is approved in accordance with the relevant federal legislation. 2) Development and associated activities do not include light sources or reflective surfaces that could distract or confuse pilots within a light restriction zone or lighting area buffer. 3) Emissions do not significantly increase air turbulence, reduce visibility or compromise the operation of aircraft engines in a strategic airport's operational airspace. 4) Development and associated activities do not attract wildlife or increase wildlife hazards within a wildlife hazard buffer zone. 5) Development and associated activities within a building restricted area do not interfere with the function of aviation facilities. 6) Development does not increase the risk to public safety within a public safety area. 7) Development within the 20 ANEF contour or greater is appropriately located and designed to prevent adverse impacts from aircraft noise.	The Project site is within the 35 to 47.5 OLS contour. Project plant and equipment will not exceed this height and as such, an approval from the Secretary of the DIRD under the Airports Act is not required. The Project site will not adversely impact on the safety, efficiency and operational integrity of the airport and aviation facilities, as described below: ■ As 24 hour operations may be required, lighting may be used during construction of the Project and consideration will need to be given to appropriate night lighting, in accordance with Civil Aviation Safety Authority's (CASA) *Manual of Standards Part 139 – Aerodromes (Lighting in the Vicinity of Aerodromes)* (refer Section 13). ■ During construction, appropriate mitigation measures will be put in place to ensure emissions do not impact on air turbulence, visibility or compromise the operation of aircraft engines. ■ Project activities are unlikely to result in safety hazards associated with wildlife, however, mitigation measures to protect wildlife are provided in Section 6.5 ■ Project activities will not interfere with the function of aviation facilities. ■ The Project site is not located within the airport's public safety area ■ Project activities do not constitute a sensitive land use and are therefore not sensitive to impacts from aircraft noise	Achieved

3.6 Local government policy and planning documents

3.6.1 Brisbane City Council City Plan 2014

3.6.1.1 Background

BCC's City Plan 2014 designates Brisbane Airport as 'Special Purpose (Airport)'. BCC's Strategic Plan within the City Plan acknowledges that major industry areas have grown around the Brisbane Airport as part of the Australia TradeCoast region that supports business growth.

Under the 'Airport Precinct' of the Australia TradeCoast Neighbourhood Plan, the City Plan states that:

> *"Appropriate land use activities are identified in the Brisbane Airport Master Plan under the control of the Brisbane Airport Corporation."*

Accordingly, the BAC Master Plan guides the intended land uses on airport land, permitting a broad range of appropriate land use activities that are consistent with BAC's development objectives for the airport.

3.6.1.2 Relevance to the Project

BAC has ensured Brisbane Airport development, where possible, is compatible with local planning strategies. The Project is located within the Airport Precinct under the Australia TradeCoast Neighbourhood Plan. Land use activities in this precinct are regulated by the BAC Master Plan.

4 Land use

4.1 Introduction

This section provides an explanation of the land uses within and surrounding the Project site. It also assesses consistency with the intent of the BAC 2014 Master Plan. Consideration is given to any existing building approvals obtained since 2014 that are within close proximity to the Project site. An assessment of any potential impacts to these land uses has been undertaken and mitigation measures have been recommended.

4.2 Methodology

A review of aerial photography has identified existing land uses within the Project site. The BAC 2014 Master Plan and Building Approvals Register were also reviewed to determine what the intended uses are for the Project site.

4.3 Relevant documents

4.3.1 BAC Master Plan

A summary of the contents of the BAC 2014 Master Plan is provided in Section 3.3.2. The Project site is located within the Airport Central (Airport Drive West) sub-precinct within the 'Mixed use' zone.

It is considered that the Project is consistent with intended uses under the 'Mixed use' zoning for the Project site. The Master Plan outcomes for this zoning are to:

i) *Provide for a diverse mix of uses tailored to the role and function of Brisbane Airport and its surrounding area and to enable a level of economic and social activity to serve the intended mix of visitors, workers and residents.*

ii) *Provide premises to accommodate firms seeking to combine their corporate office and manufacturing and distribution industry functions.*

iii) *Provide for a mix of industrial activities, commercial enterprises and workshops, facilitated and supported by office activities set in a business park environment.*

iv) *Development provides for a wide range of industry and business uses, including clean low impact industry, research and technology facilities, knowledge creation and entrepreneurial activities and service industries that are more compatible with urban areas.*

v) *Development results in a use that activates the Mixed Use zone at different times of the day and week to create a vital and vibrant environment.*

vi) *Ensure a high quality commercial environment with an intensity and form of development that is tailored to the location.*

vii) *Provide for development that capitalises on proximity to Australia TradeCoast and Brisbane Airport commercial environment.*

viii) *Development of buildings is of a height, bulk, scale and form tailored to its specific location and to the characteristics of the site.*

ix) *Development provides a built form that creates a consistent and cohesive streetscape and aligns with pedestrian connections and shelter.*

x) *Development provides consistent and cohesive landscape and streetscape treatments.*

xi) *Development is sensitively designed and operated to avoid or mitigate any potential adverse impact on an adjoining use.*

xii) *Enables interim uses within the zone prior to land being needed for development activities.*

A range of intended uses for this zone are listed in the BAC 2014 Master Plan and includes hotels, outdoor sales, recreation and sport facility and showroom. Given that this Project is for the earthworks component of a test track, car dealerships, hotels and exhibition and conference activities, it is considered that the Project is consistent with the intended use of the land.

4.4 Existing environment

4.4.1 Aerial photograph review

The Project site is moderately disturbed and predominately contains casuarina plantations with some mangrove communities and grasslands. There are two main drainages lines that traverse the Project site, which are connected to Landers Pocket Drain, including one that flows from Nancy Bird Way in the north and another than flows across the Project site from Moreton Drive. There are a number of existing fire trails and tracks that run through the Project site, which will be removed during Project works.

The Project site is surrounded by a combination of airport activities, car parking, new developments and casuarina plantations, including:

- Central Parking Area (CPA), including the remote public car park (located along Nancy Bird Way and Ivy May Way)
- Brisbane Airport Services Centre (located on the corner of Moreton Drive and Nancy Bird Way)
- Kingsford Smith Memorial and the Southern Cross Aircraft (located on the corner of Airport Drive and Nancy Bird Way)
- International Terminal, including car parking and hire cars
- Airtrain (International Terminal) Station
- Warehouses and commercial tenancies (located along on Qantas Drive)

Beyond the immediate proximity of the Project site and north of the Kedron Brook is the Nudgee Golf Course, Banyo industrial and residential areas, the North Brisbane Junior Motorcycle Club, St Paul's Theological College, and the Earnshaw State College. Located to the south of the Project site are the Eagle Farm and Pinkenba industrial areas, the Pinkenba residential community and port facilities. The nearest sensitive residential receptors to the Project site include:

- Northgate State School (2.6 km west)
- Hendra State School (2.75 km south west)
- Novotel Hotel (1.8 km south west)
- Tadpoles and Joey Club Childcare Centre (2.1 km south west)
- Pullman and Ibis Hotel (1.5 km north) (under construction)

4.4.2 Current development activity

A search of BAC's Register of Building Applications (2017) identified a number of current building applications and approvals within close proximity to the Project site (refer Table 4.1).

Table 4.1 Current building applications and approvals within close proximity to the Project site (as at 9 June 2017)

Application Ref No.	Details	BAC Determination	ABC Determination
2014/032	Landers Pocket Drain Relocation	Consent Issued – 17/10/2014	Building Approval Issued – 28/10/2014, 26/11/2014
2014/045	CPA Staff Car Park Stage 3 & 4 – 8 Bert Hinkler Drive	Consent Issued – 13/07/2015	Building Approval Issued – 27/07/2015, 11/11/2015
2014/046	Banksia Place Car Park	Consent Issued – 23/10/2014	Building Approval Issued – 10/11/2014
2014/054	Hertz CPA Shade Sail – 22 Ivy May Way	Consent Issued – 27/03/2014	Building Approval Issued – 11/04/2014
2014/069	Modification of Advertising Sign 4001-06-I – Airport Drive	Consent Issued – 14/05/2014	-
2014/112	Phase 2 NPR Project	Consent Issued – 05/02/2016 03/08/2016	Building Approval Issued – 01/03/2016, 05/09/2016
2014/116	CPA Rental Overflow Facility – 7 Ivy May Way	Consent Issued – 26/06/2015	Building Approval Issued – 21/07/2015
2014/178	ITB to Service Centre Shared Path – Nancy Bird Way & Great Barrier Road	Consent Issued – 19/11/2015	Building Approval Issued – 21/01/2016
2015/046	Banksia Place Amenities Upgrade	Consent Issued – 07/05/2015	Building Approval Issued – 17/06/2015
2015/057	CPA Remote Public Car Park – Nancy Bird Way	-	-
2015/063	Airservices Onesky Project – Airport Drive, ATSC Centre	Consent Issued – 22/03/2016	Building Approval Issued – 31/03/2016, 01/05/2016
2015/101	Fitout for Repco at Building 212 – 51-57 Qantas Drive	Consent Issued – 08/09/2015	Building Approval Issued – 08/09/2015
2015/137	Installation of Pylon Sign for KFC – Corner of Moreton Drive and Nancy Bird Way	Consent Issued – 06/10/2015	Building Approval Issued – 13/11/2015
2015/188	CPA Fibre Link – South West Corner of Moreton Drive and Nancy Bird Way	Consent Issued – 16/02/2016	Building Approval Issued – 08/03/2016
2016/016	Direct Couriers – 20-24 Qantas Drive	Consent Issued – 27/06/2016	Building Approval Issued – 15/08/2016
2016/021	Department of Agriculture and Water Resources Stage 2 Alterations – 42-44 Qantas Drive	Consent Issued – 26/05/2016	Building Approval Issued – 03/06/2016
2016/044	Department of Agriculture and Water Resources Stage 3 Alterations – 42-44 Qantas Drive	Consent Issued – 05/09/2016	Building Approval Issued – 05/09/2016
2016/068	Brisbane Control Tower Complex Life Extension Project	Consent Issued – 20/10/2016	Building Approval Issued – 08/11/2016
2016/088	Sandvik Fire Panel Replacement – 60-62 Qantas Drive	Consent Issued – 07/09/2016	Building Approval Issued – 22/09/2016
2016/150	Fit Out of Australian Federal Police – Qantas Drive	Consent Issued – 22/11/2016	Building Approval Issued – 13/12/2016
2017/008	FedEx Building Hardstand Extension – Qantas Drive	Consent Issued – 31/01/2017	Building Approval Issued – 24/02/2017

Source: BAC 2017

4.4.3 Current services

A number of existing services are located within the Project site. An underground Energex high voltage cable runs through the site from Airport Drive to Moreton Drive and a substation is present in the southern portion of the Project site. An underground high voltage cable also runs across the north corner of the Project site from the Service Centre on Nancy Bird Way to the CPA.

An underground gas pipe also runs across the north western boundary of the Project site.

Drainage lines also run across the Project site connecting two culverts underneath Nancy Bird Way, one culvert underneath the southern section of Airport Drive, and two culverts underneath Moreton Drive.

4.5 Potential impacts

Given the existing condition of the Project site, site preparation works will be required prior to the commencement of construction, including vegetation clearing, ground improvement works, filling, crushing, surcharging and realignment of the drainage channels. As such, there is the potential for the Project to cause minor impacts to the surrounding land uses.

The Kingsford Smith Memorial, which houses the Southern Cross Aircraft, is located approximately 95 m from the north eastern corner of the Project site and is a publically accessible heritage place listed on the Brisbane Airport Heritage Register.

Potential dust and noise emissions may occur during construction of the Project. Assessment and mitigation of dust and noise issues is discussed in Sections 8 and 9 respectively.

During construction, the Project may impact on the existing municipal services located within the Project site, particularly the underground Energex high voltage cable. Once confirmation of the type, depth and location of these services is confirmed, any potential impacts will be managed during the Project design.

The construction of the Project will not result in significant impacts to traffic circulation in the surrounding area, although temporary disruption may occur for short periods (refer Section 13). Minor impacts to accesses of surrounding properties and tenancies may be experienced.

Overall it is considered that there would be minimal impacts to surrounding land uses, however, any ecological and social impacts will be managed in accordance with the mitigation measures outlined in Sections 6.5 and 10.6, respectively.

4.6 Mitigation measures

Table 4.2 recommends management measures to mitigate the potential impacts identified above.

Table 4.2 Land use potential impacts and mitigation measures

Potential environmental aspect/impact	Management objective	Action	Phase to be implemented	Outcome
Access restrictions and impacts to traffic circulation during construction the Project	Minimise impacts to adjacent tenancies and airport users access during construction	■ Undertake consultation with adjacent tenancies to notify them of the Project ■ Implement the traffic management measures as recommended in Section 13.6	Pre-construction/ construction	Requirement to be included in the EMP
Disturbance to Energex and BAC services	Undertake consultation with service providers to determine appropriate relocation procedures	■ Energex and BAC services will need to be protected in consultation with Energex and asset managers in BAC to determine the need for any consent and access arrangements	Detailed design/ pre-construction	BAC to address
Dust, noise and vibration impacts to adjacent land uses	Minimise dust and noise impacts to adjacent tenancies and residents through the implementation of dust and noise monitoring programs	■ Implement dust, noise and vibration monitoring programs and mitigation measures as outlined in Sections 8.7 and 9.6 respectively	Detailed design/ construction	Requirement to be included in the EMP

5 Geology, soils, topography and contaminated land

5.1 Introduction

This section outlines the issues relating to geology, soils, topography and land contamination associated with the Project and discusses appropriate mitigation measures to be undertaken during the construction phase.

5.2 Methodology

A desktop review of the background information, mapping, databases and existing reports has been undertaken, as well as a review of relevant legislation and guidelines, to identify the existing conditions within the Project site.

Aurecon has undertaken a review of reports detailing the topography, geology, soils and site history within the Project site. In particular, Golders (2016a; b) have undertaken a contamination assessment of soil and groundwater, including a risk assessment for per- and poly- fluoroalkyl substances (PFAS), in addition to an acid sulfate soil (ASS) assessment (Golders 2016c; d). Findings from these reports have been incorporated into the EAR with the full investigations provided in Appendices D and E respectively. Golders have prepared an ASS Management Plan for the Project which is provided in Appendix F.

PSK Environmental prepared an Asbestos Containing Materials (ACM) Management Plan to be implemented should any ACM be identified on the surface or in the soil recovered during clearing and excavation works. The ACM Management Plan has been provided in Appendix G.

Potential impacts were able to be identified based on a review of this information, and mitigation measures to address these potential impacts have been recommended.

5.3 Relevant documents

5.3.1 Airports (Environment Protection) Regulations 1997

Schedule 3 of the AEPR outlines accepted limits for soil pollution. Baseline data collected as per the Golder Contamination Assessment, and Acid Sulfate Soil Assessment Reports for the Auto Mall project, in addition to NEPM procedures, are to be incorporated as part of the project assessment framework.

5.3.2 National Environment Protection (Assessment of Site Contamination) Measure 1999 (Amendment 1, 2013)

Schedule B1 of *National Environment Protection (Assessment of Site Contamination) Measure 1999* (Amendment 1, 2013) (NEPM 2013) provides a framework for the use of investigation and screening levels. The framework is based on a matrix of human health and ecological soil and groundwater investigation and screening levels and guidance for specific contaminants. These measures are more up to date criteria than the AEPR soil pollution limits and as a consequence should be adopted where relevant and approved by the AEO.

5.3.3 Health Based Guidance Values for PFAS for Use in Site Investigations in Australia

In April 2017, the Department of Health released final health based guidance values (HBGVs) for PFAS in drinking water and recreational water based on a tolerable daily intake produced by Food Standards Australia and New Zealand.

5.3.4 CRC Care Assessment management and remediation for PFOS and PFOA

The Cooperative Research Centre for Contamination Assessment and Remediation of the Environment (CRC Care) (2017) released Technical Report No. 38, which provides screening levels for PFAS in soil and water for the protection of human health and the environment.

CRC Care (2017) has derived health screening levels (HSLs) for PFAS in soil for low density residential (HSL (A)), high-density residential (HSL (B)), open space/recreational (HSL (C)) and commercial/industrial (HSL (D)). The Project site is considered to be commercial/industrial and as such, HSL (D) will apply.

For PFAS in marine water, the 95% species protection value for slightly to moderately disturbed marine systems will be adopted.

5.3.5 Managing PFC Contamination at Airports – Interim Contamination Management Strategy and Decision Framework (GHD 2015)

GHD prepared the guideline *Managing PFC Contamination at Airports – Interim Contamination Management Strategy and Decision Framework* for Airservices Australia and DIRD for the management of PFAS on Airport Land.

This guideline provides interim screening levels (ISLs) in soil, groundwater and surface water for the protection of human health and the environment.

5.4 Existing environment

This section provides an overview of the existing condition of the Project site in regards to topography and erosion potential, geology and soil landscape, ASS and contaminated land.

5.4.1 Geology and soils assessment

5.4.1.1 Topography

As reported in Golders (2016a; b), the Project site is typically flat and low-lying with a surface elevation of approximately 2.4 m AD. The Project site is heavily dominated by planted casuarina forest and mangroves. Man-made drainage channels cross the southern and northern portions of the site. Low lying areas are present in multiple areas across the site, accumulating water during periods of high rainfall, and also potentially during high tide events. Landers Pocket Drain is the closet major surface water body feature, located approximately 100 m west of the Project site (across Moreton Drive). Surface water in Landers Pocket Drain flows into the Kedron Brook Floodway Drain. The ultimate receiving environment of surface water is Moreton Bay. Further detail on the site hydrology is provided in Section 7.

5.4.1.2 Geology and soil landscape

5.4.1.2.1 Desktop assessment

A summary of the geology and soils of the Project site has been provided based upon a review of existing mapping information and the ASS investigations undertaken by Golders (2016c; d). *The Soil Landscapes of Brisbane and South-Eastern Environs, Queensland* (CSIRO 1987) indicates that the Project site is situated within an alluvial landscape likely to feature the *Woongoolba* landscape comprising:

- Dominant Soil Group – humic gleys, peaty gleys and solonchaks

- Landscape and Parent Geology – low (coastal) plains of alluvium and narrow depressions

These soil profiles are young alluvium that frequently contains moderate to high concentrations of pyritic material and fine organic matter. This soil unit is generally associated with ASS.

The Brisbane Queensland Geological Series Map (Department of Mines, Sheet 9543, 1986, scale: 1:100,000) indicates that the Project site is located on alluvial deposits of Holocene age.

A search of the Australian Soils Resource Information System (ASRIS) online mapping (CSIRO 2017) on 15 March 2017 indicates that the Project site has an Anthroposol soil profile which comprises sand, loamy sand or clayey sand horizon (<10%) underlain by a light to light medium clay horizon (35-45%) with a surface and subsurface pH level of approximately 3.0 to 4.8.

5.4.1.2.2 Results from fieldwork

Soil profiles encountered by Golders (2016c; 2016d; 2016e) during their investigations comprised:

- Crust (Topsoil) – A desiccated layer generally comprising loose silty sand and sandy clay generally between 0.1 to 0.3 m bgl
- Recent Alluvium (Holocene) – Compressible, inter-bedded sandy clays and clayey sands (Upper Holocene) from approximately 0.0 to 9.0 m bgl
- Younger Alluvium (Holocene) – Highly compressible, inter-bedded sandy clays and clayey sands (Upper Holocene) and silty clays (Lower Holocene) extending to depths up to 30 m bgl in some areas
- Older Alluvium (Pleistocene) – Stiff to very stiff clays, medium dense sands, and firm to hard clayey silt up to a depth of 30 m bgl.
- Bedrock – Fine to medium grained with low to medium strength (either basalt or sandstone).

These findings are consistent with the literature detailed in Section 5.4.1.2.1.

5.4.2 Site history

5.4.2.1 Site history findings

A historical title search confirms that the Commonwealth of Australia has owned the Project site since 1994.

Contaminated sites on Brisbane Airport land are listed on a Contaminated Sites Register (CSR) which BAC maintains. Upon review of the AES (BAC 2014a), one site was listed on the CSR as occurring within the Project site (Site 28). Two additional sites (Sites 36 and 47), which are thought to have contained commercial service stations, were located within close proximity to the Project site but are not likely to impact the proposed works.

Site 28 is located within the Project site and is listed as low risk according to the Brisbane Airport CSR. Golders (2016a; 2016b) identified Site 28 as black sands, which is '*located at the southern end of the Auto Mall Precinct within the Stage 2 investigation area, on the boundary with the Stage 1 investigation area*'. Potential contaminants of concern associated with the black sands include heavy metals, minerals and radioactivity (Golders 2016b).

No additional sites listed on the CSR are located within the Project site.

During the construction of the Brisbane Airport precinct, mineral sands may have been placed on the Project site. The mineral sands were likely to be sourced from the mining activities on North Stradbroke Island where rutile, zircon and ilmenite are mined. These minerals contain titanium and zirconium metals as well as associated naturally occurring radioactive materials (Golders 2016a).

A review of historical aerial photographs indicates that the Project site itself has also been used for agricultural purposes from 1946 (the earliest historical aerial photograph available) until the early 1980s.

Filling of the Project site occurred in the 1980s with the fill material likely to have been excess sand sourced from Moreton Bay or North Stradbroke Island for the development of Brisbane Airport (Erskine 1990). In 1983, during filling of the Project site, surface water drains were also installed.

The historical aerial photographs also indicate the following:

- 1987 – Kingsford Smith Memorial erected at the intersection of Nancy Bird Way and Airport Drive
- 2007 – Energex substation constructed within the Project site
- 2009 – Southern portion of the Project site used as an asphalt batching plant and for stockpiling for the Moreton Drive construction

5.4.3 Acid sulfate soils assessment

5.4.3.1 Findings

This section provides a summary of the findings from the ASS investigations undertaken by Golders (2016c; 2016d). For the ASS investigations, the site was divided into stages; Stage 1 (north of the Energex cable) and Stage 2 (south of the Energex cable). Sampling locations are provided in Figure 5.1.

The Department of Natural Resources and Mines, 1:100,000 scale Map 1 "Acid Sulfate Soils – Tweed Heads to Redcliffe" indicates that the site is situated in an area mapped as:

> *"Acid Sulfate on Disturbed Land - disturbed land (eg canal estates, marinas, aquaculture, quarry, urban, and industrial likely to contain ASS In some cases partial or full treatment may have been undertaken). Limited field investigation."*

A search of the ASRIS online mapping (CSIRO 2017) on 14 March 2017 indicates that the Project site is classed as A2, which is a high probability of ASS occurring with moderate confidence.

Based on previous ASS investigations undertaken by Golders (2016c; d), medium to high levels of actual acid sulfate soil (AASS) and potential acid sulfate soil (PASS) occur within the proposed Project site.

The Stage 1 ASS investigation determined that AASS materials are present from the ground surface to depths approximately 0.8 m AD and 1.2 m AD and deeper in isolated pockets where previous localised ground disturbances may have occurred (Golders 2016c). AASS was detected in materials below the water table which indicated that the groundwater table had been historically lower in this area (Golders 2016c). Calculated liming rates to neutralise net acidity in the identified AASS materials range from about 5 kg/m^3 to 30 kg/m^3. PASS materials underlie the AASS materials across the Stage 1 site, however net acidity varies considerably. Calculated liming rates to neutralise net acidity in the identified PASS materials include:

- 15 kg/m^3 to 60 kg/m^3 (northern and southern ends of Stage 1 area)
- 90 kg/m^3 to 150 kg/m^3 and up to 320 kg/m^3 (centre of the Stage 1 area)

The Stage 2 ASS investigation by Golders (2016d) indicated that AASS materials are present from the ground surface to depths of approximately -0.13 m AD. AASS has been detected in materials below the water table which indicates that the groundwater table has been historically lower (Golders 2016d). Calculated liming rates to neutralise existing acidity in the identified AASS materials range from about 3 kg/m^3 to 13 kg/m^3. PASS materials are present from approximately 3.33 m AD to -0.33 m AD and throughout the majority of the sampling locations. Calculated liming rates to neutralise net acidity in the identified PASS materials includes:

- 3.0 kg/m^3 to 14.2 kg/m^3 (southwestern quadrant of the Stage 2 area)
- 12.9 kg/m^3 (centre of the Stage 2 area)
- Up to 284 kg/m^3 (north western boundary of Stage 2 area)

Groundwater samples collected from the Project site suggest a variable or historically disturbed environment. At the northern end of the Stage 1 area, the groundwater had adequate buffering capacity to maintain an acceptable pH level in the presence of minor acid generation. However, groundwater samples from the remainder of the Stage 1 area and across the Stage 2 area indicated a buffering capacity inadequate to maintain stable, acceptable pH level in areas vulnerable to acidification.

Full copies of the investigations are provided in Appendix D.

5.4.3.2 Relevance to the Project

Medium to high levels of AASS and PASS occur within the Project site and as such, an ASS Management Plan has been prepared for the Project, which incorporates a number of measures to mitigate and control potential impacts relating to the disturbance of ASS and groundwater during earthworks (refer Appendix F).

5.4.4 Contaminated land assessment

5.4.4.1 General contaminants

5.4.4.1.1 General

Golder (2016a; b) conducted a contamination assessment of the soil and groundwater within the Project site from December 2015 to October 2016. For the contaminated land investigations, the site was divided into stages; Stage 1 (north of the Energex cable) and Stage 2 (south of the Energex cable). Findings are summarised below.

Golders (2016a; b) identified a known contaminated site (Site 28 – black sands) which is '*located at the southern end of the Auto Mall Precinct within the Stage 2 investigation area, on the boundary with the Stage 1 investigation area*'. Potential contaminants of concern associated with the black sands include heavy metals, minerals and radioactivity (Golders 2016b). No additional CSR listed sites were identified within the Project site.

Golders (2016a; b) identified an asphalt batching plant in the southern portion of the Project site (utilised in 2009), which was associated with the construction of Moreton Drive. This potential contamination source includes potential contaminants of concern including polycyclic aromatic hydrocarbons, phenols and total recoverable hydrocarbons (Golders 2016a; b).

Full copies of the investigations are provided in Appendix E.

5.4.4.1.2 Soils

No exceedances of the AEPR guidelines were detected for heavy metals. Exceedances were detected above the NEPM 2013 environmental investigation levels (EILs) for nickel and zinc in four shallow soil samples collected from the western and eastern portions of the Project site. However, the 95% Upper Confidence Limit (UCL) for nickel and zinc in the soil is below the EILs (Golders 2016b). Titanium concentrations are present in the eastern portion, potentially relating to the historical placement of mineral sands (Golders 2016b).

Results from the subsurface boreholes found layers of material possibly associated with mineral sand deposition at five borehole locations, generally between 0.0-0.1 m bgl, with one layer being detected between 0.5-0.6 m bgl and another being detected at 1.75-2.0 m bgl. These samples were tested for the presence of naturally occurring radioactive materials using a Thermo Scientific *Radeye*™ radioactivity meter. No levels were reported higher than the background radiation levels for these samples, nor during a site walk over measuring radioactivity levels at ground level.

5.4.4.1.3 Groundwater

Five groundwater wells were sampled and analysed for filtered metals and metalloids in October 2016 (Golders 2016a; b). Concentrations of nickel and zinc above the AEPR Marine Water guidelines and NEPM 2013 Marine Water groundwater investigation levels (GILs) were detected in all samples collected.

5.4.4.1.4 Relevance to the Project

Despite minor elevated metal and metalloid concentrations detected, Golders (2016a; b) concluded that a Contamination Management Plan for the two areas of the Project site (Stage 1 and Stage 2) is not required.

5.4.4.2 PFAS

5.4.4.2.1 Findings

It is understood that PFAS are present in the groundwater across Brisbane Airport. No known or potential PFAS contaminating activities were identified within or in the vicinity of the Project site. Known PFAS source areas at Brisbane Airport include the fire rescue training facilities and fire stations. Golders (2016a; b) have identified the nearest potential sources of PFAS to be:

- Satellite Fire Station, located approximately 3.9 km north of the Project site
- Fire Rescue Training Area, located approximately 4.8 km north of the Project site
- Main Fire Station, located approximately 2.3 km north east of the Project site
- JUHI facility along Hakea Street, located approximately 780 m north-east of the Project site
- Former JUHI facility along Lomandra Drive, located approximately 1.3 km south of the Project site

Golders (2016a; b) conducted an assessment of potential impacts and risks relating to soils, groundwater and potential off site migration of groundwater impacted with PFAS within the Project site during December 2015, with supplementary investigations completed during October 2016. Sampling locations targeted areas with potential contamination (ie locations with historical use of firefighting foams and at the CSR site).

Results from the soil sampling were analysed for PFAS. Concentrations of perfluorooctanesulfonic acid (PFOS) and/or perfluorohexanesulfonic acid (PFHxS) were present within the soil at four locations and were below the ISLs (GHD 2015) and HSL (D) (CRC Care 2017).

Results from the groundwater assessment also detected PFAS concentrations above the laboratory limit of reporting in the majority of samples but below the HBGV for drinking water (0.07 µg/L) in all instances except AM-MW14 and AM-MW16 in October 2016. All groundwater samples are below the HBGV for recreational water (0.7 µg/L).

Concentrations of PFAS were detected above the laboratory limit of reporting at the groundwater monitoring wells detailed in Table 5.1 and Figure 5.2.

Table 5.1 Groundwater concentrations of PFHxS and PFOS above the laboratory limit of reporting

Monitoring well	Concentration of PFHxS and PFOS (µg/L)
AM-BH08	0.004 (January 2016) 0.015 (October 2016)
AM-BH19	0.007 (January 2016) 0.007 (October 2016)
BIP/MW1	0.006 (January 2016) 0.019 (October 2016)
BIP/MW2	0.002 (January 2016) 0.002 (October 2016)
AM-MW10	0.066 (October 2016)
AM-MW14	0.405 (October 2016)
AM-MW15	0.054 (October 2016)
AM-MW16	0.314 (October 2016)

All groundwater samples had concentrations of PFOS exceeding the surface water ISL for human consumption of fish/aquatic species (0.65 ng/L) under the *Managing PFC Contamination at Airports – Interim Contamination Management Strategy and Decision Framework* (GHD 2015). However, it is

noted that this ISL is three times lower than the laboratory limit of reporting, using laboratory ultratrace methods, and therefore even non-detects will exceed this ISL.

Full copies of the investigations are provided in Appendix E.

5.4.4.2.2 Relevance to the Project

Despite minor elevated PFAS concentrations detected in the soil and groundwater, the risk to aquatic ecosystems and human health is considered low and Golders (2016a; b) concluded that a Contamination Management Plan for the two areas of the Project site (Stage 1 and Stage 2) is not required.

5.5 Potential impacts

5.5.1 Geology and soils impacts

During construction, existing soils and vegetation will be disturbed and there is potential for erosion and sedimentation to occur due to stockpiling and removal of vegetation if suitable control measures are not implemented. There is also the potential for erosion and sedimentation to occur due to crushing, screening and stockpiling of materials if suitable control measures are not implemented.

The Project site may also be susceptible to minor soil contamination during construction in instances where hydrocarbon or chemical leaks and small scale spills from construction vehicles and machinery occur.

5.5.2 Acid sulfate soils impacts

Golders (2016c; d) provided a summary of potential impacts that could occur as a result of ASS within the Project site:

- Any site excavations will disturb ASS and will require management measures including lime treatment of excavated spoil. Excavation of the proposed perimeter drains to RL 0.2 m AD will result in AASS spoil and oxidation of PASS, which may require separate management measures.
- Filling and surcharging/preloading of the site will result in further AASS being “pushed” below the water table. Surcharging/preloading will also cause a slight mounding of the local water table, resulting in the temporary saturation of AASS. These will result in the release of acid to the groundwater and the subsequent stripping and mobilisation of metals. Groundwater impacted by acidity and metals may discharge to the surface and/or shallow drains immediately surrounding the Project site, but cannot discharge into Landers Pocket Drain as the site is bunded from external drains.

5.5.3 Contaminated land impacts

There is the potential for ground disturbance associated with the construction of the Project to disturb and/or mobilise contamination in soil and groundwater. Aquatic ecosystems and persons who consume fish or other aquatic species downstream from where groundwater discharges into the receiving environment may be impacted from groundwater contamination.

In addition, if contaminated soils and groundwater are encountered during Project works, there is the potential for construction contractors to be exposed to contamination.

Based on Golders (2016a; b) investigations, concentrations of PFAS and metal/metalloids (nickel and zinc) were detected in the groundwater at the Project site. However, these contaminant concentrations are considered to be low and as such, the qualitative risk to human and aquatic ecosystem receptors is a low risk and can be mitigated through implementation of the measures outlined in Section 5.6.

5.6 Mitigation measures

A range of mitigation measures have been recommended to address the potential impacts listed in Section 5.5 to geology, soils, topography and contamination are provided in Table 5.2 below.

An ASS Management Plan and an ACM Management have been prepared and are provided in Appendices F and G respectively.

Table 5.2 Soils, topography, geology and contaminated land potential impacts and mitigation measures

Potential environmental aspect/ impact	Management objective	Action	Phase to be implemented	Outcome
Soil erosion and soil stability				
Soil erosion and sedimentation of exposed soils Importation of fill may result in erosion and sedimentation	Implement an Erosion and Sediment Control Plan during construction	■ Develop and implement an ESCP in accordance with relevant standards and guidelines, following these general requirements: – All erosion and sediment control measures shall be constructed and maintained as per International Erosion Control Association (IECA) (2008) standard drawings – All erosion and sediment control devices shall remain in place until site stabilisation has been achieved, as directed by the BAC Environmental Advisor – Any potentially sediment-laden stormwater runoff shall pass through a sediment control device prior to discharging from the Project site – All materials received for crushing at the Project site must be stockpiled and crushed within the Project site with erosion and sediment control in place, in consultation with the BAC Environmental Advisor ■ The ESCP is to be prepared by a suitably qualified and experienced professional in accordance with the requirements of the IECA Guidelines (2008) (eg a Certified Professional in Erosion and Sediment Control (CPESC) or a Registered Professional Engineer of Queensland (RPEQ) with at least two years' experience in the management of erosion and sediment control that can be verified by an independent third party)	Detailed design/ construction	Requirement to be included in the EMP
Soil erosion and sediment entering watercourses after vegetation removal and/or during bulk earthworks	Adopt erosion controls to minimise the erosion potential of the Project site	■ For any completed earthworks or disturbed areas where construction is likely to be suspended, cover requirements are to be determined in consultation with the BAC Environmental Advisor and be in accordance with the IECA Guidelines (2008). The types of cover considered should include hydromulch, soil stabilising polymers, grasses, erosion control blankets etc. ■ A perimeter drain to be installed on site for collection of runoff for treatment prior to discharge or for use as a dust suppressant during construction where necessary ■ Staged land disturbance is to be completed where possible and include progressive stabilisation to minimise the duration of exposed soils	During construction	Requirement to be included the EMP

Potential environmental aspect/ impact	Management objective	Action	Phase to be implemented	Outcome
Sediment being tracked onto paved areas	Avoid tracking sediment onto paved road areas	■ Prior to leaving site, all construction plant in contact with site flora are to be inspected and cleaned as necessary to prevent the transport of fire ants, weeds and seeds ■ All vehicles leaving the site will exit via the following sediment control measures: – Primary treatment across rock surfaced roadways of nominally 120 m for trucks and plant and a minimum 50 m for light vehicles – All vehicles will traverse a minimum of three rumble/ shaker grids (approximately 7.5 m in length). All vehicles will then traverse over a two part (7 m plus 13 m) mass concrete driveway separated by rock – As a final tertiary measure, all vehicles will travel north on Airport Drive on an existing asphalt pavement (one lane of Airport Drive, which form part of the Project site) for a minimum of 340 m allowing "within site" control of sediment	During construction	Requirement to be included the EMP

Potential environmental aspect/ impact	Management objective	Action	Phase to be implemented	Outcome
Inadequate maintenance of ESC measures	Adopt proven maintenance principles across the Project site	■ The following maintenance principles should be adopted on site: – Maintenance of erosion and sediment control measures should continue until the Project site has been suitably stabilised and further disturbance of soil by erosion is prevented – Sufficient stockpiles of mulch, geotextile and/or other materials required for erosion and sediment control must be maintained on site to enable ongoing erosion control – Uncontaminated sediment removed from erosion and sediment control devices may be stockpiled and reused in landscaping or other fill projects, otherwise must be disposed of in an approved environmentally safe manner – Maintenance must be undertaken in accordance with requirements of IECA (2008) including standard drawings ■ Review the erosion and sediment control measures for effectiveness and check maintenance records ■ Ensure all external drains are bunded from the Project site prior to undertaking earthworks within 50 m of inlets ■ Consider the use of bunds and containment areas to be adopted as corrective actions in the event of a non-conformance ■ The Construction Contractor is required to notify the site Superintendent immediately of any incidents with the potential to impact on water quality ■ An incident/accident report form is to be filled out if any non-conformances are found	During construction	Details to be provided in the detailed ESCP

Potential environmental aspect/ impact	Management objective	Action	Phase to be implemented	Outcome
Disturbance of ASS due to excavation and filling areas				
Adverse impacts arising from disturbance and treatment of ASS (fill and natural) on site	Avoid adverse impacts on the local receiving waters due to the placement of fill material	■ Comply with the requirements of the ASS Management Plan, including: – Staged construction of a lime cut-off trench along the western, southern and eastern boundaries of the Project site prior to commencement of filling/surcharging, within 50 m of the end of the installed trench until fully completed (northern boundary already contains suitable buffering capacity) – Placement of a 10 m wide strip of surface lime 'guard layer' under the perimeter of each surcharge area prior to placement of the drainage blanket, where wick drains are installed, to neutralise any seepage resulting from wick drains – Excavated ASS materials to be managed by stockpiling within nominated section of fill/surcharge platform and neutralising by lime treatment – Progressive construction of the perimeter drain in staged sections to monitor and treat groundwater discharges – Incorporation of lime into the walls and base of the perimeter drain to neutralise discharges to groundwater (higher lime application rates along the western site boundary to buffer acidic groundwater) – Isolation of drains from external discharge ■ During periods of earthworks, a weekly inspection will be undertaken by the BAC Environmental Advisor with the AEO invited to attend. Following completion of earthworks, inspections will be reduced in frequency, in consultation with the AEO	Detailed design/ construction	Review and comply with ASS Management Plan during detailed design and construction
Disturbance of contaminated land				
Unexpected finds of contaminated soil during earthworks	Minimise exposure to potentially contaminated soil and manage unexpected finds of contaminated soil	■ Immediately cease works in the event that odours, staining or any other signs of contamination are observed ■ Commission a suitably qualified person to investigate potential contamination and provide recommended management measures	Detailed design / construction	Requirement to be included in the EMP

Potential environmental aspect/ impact	Management objective	Action	Phase to be implemented	Outcome
Ground disturbance has the potential to disturb and/or mobilise contamination in soil and groundwater	Minimise soil disturbance in contaminated areas	■ Comply with the following: – For any existing material that requires removal from Airport land, testing of the excavated material should be undertaken in accordance with the legislative requirements for landfill disposal. The material could be tested immediately prior to excavating, or could be excavated and placed in a suitably bunded area for testing. – For any potentially contaminated material to be taken off Airport land, appropriate approvals and a Soil Disposal Permit should be obtained under the EP Act. – Implement the ACM Management Plan for the Project – For unexpected contamination finds such as odours, staining or other signs of contamination which are encountered during construction activities (eg if any deep excavations are required below the level of the clean imported fill), a suitably qualified consultant should be commissioned to assess the potential impact and recommend additional management strategies if required. ■ Details on the proposed groundwater monitoring for potential contamination issues are outlined in Section 7.6	Construction	Review and comply with recommendations during construction
Ground disturbance has the potential to disturb and/or mobilise contamination at CSR Site 28 (Black sands)	Minimise soil disturbance at CSR Site 28	■ Should potential contaminated materials (black sands) be observed during excavation within the CSR Site 28, material is to be stockpiled and the BAC Environmental Advisor is to be consulted for approval of investigation and management measures (in consultation with the AEO) ■ These soils are to be stockpiled separately from other excavated soils or imported fill and are not to be placed in direct contact with the ground ■ All personnel involved in identifying and handling contaminated material are to be appropriately trained and possess/use appropriate PPE as required ■ During surcharging activities at CSR Site 28, groundwater monitoring is to be conducted on a monthly basis with groundwater samples analysed for metals/metalloids (including titanium) (refer Section 7.6 for further information regarding groundwater monitoring)	Construction	Review and comply with recommendations during construction

Potential environmental aspect/ impact	Management objective	Action	Phase to be implemented	Outcome
Waste soils				
Storage and disposal of waste soil material including soil placement may result in sediment runoff and/or degradation of waterways	Minimise construction wastes and prevent impacts	■ Design material stockpile areas and diversion drains to ensure protection from erosion and mobilisation of sediment resulting from runoff ■ Locate material stockpile areas away from drainage pathways and waterways (with appropriate erosion and sediment control devices installed) ■ Provide adequate disposal facilities for all types of construction wastes (refer Section 12 for further information), noting that the Project site will be isolated from external waterways during earthworks construction.	Detailed design/ construction	Requirement to be included in the EMP
Soil, surface water and groundwater contamination				
Establishment and operation of construction sites may result in contamination of site soils, surface water and groundwater	Minimise on site sources of soil and water contamination	■ Design to locate construction carpark, laydown areas and construction site compounds away from drainage pathways and waterways ■ Drainage channels/storage basins constructed to prevent the escape of potential contaminants to groundwater ■ Identify “no go” zones and restricted access and haul routes ■ Manage waste spills on site to prevent soil contamination with the use of spill kits and user training ■ Store materials and hazardous substances in accordance with AS1940-2004: The storage and handling of flammable and combustible liquids ■ All waste generated on site is to be appropriately handled and disposed (refer Section 12)	Detailed design/ construction	To be addressed during detailed design by BAC and requirements to be included in the EMP.

6 Ecology

6.1 Introduction

This section assesses the potential impacts of the Project upon flora and fauna. Suitable management and mitigation measures are proposed, where necessary.

As discussed in Section 3.1, the Project site is located on Commonwealth owned Airport land, therefore State Government legislation is not strictly applicable. Notwithstanding, this section addresses legislative requirements of both Commonwealth and State Governments, where applicable, for the benefit of decision-makers wishing to show due consideration to both State and Commonwealth ecological matters.

6.2 Methodology

The following tasks were undertaken to assess the ecological value of the Project site.

6.2.1 Desktop review

Relevant environmental databases and maps were reviewed to identify potential ecological constraints as well as significant flora and fauna species that may occur within the Project site. The following databases, maps and documents were reviewed:

- Aerial photographic images
- EPBC Protected Matters Database (3 km search-radius around the Project site) provided by DoEE (March 2017) (refer Appendix C)
- Wildlife Online (3 km search-radius around the Project site) provided by EHP (2017a) (refer Appendix C)
- Regional Ecosystem (RE) mapping provided by EHP (2017b)
- Regrowth Vegetation mapping provided by EHP (2017c)
- Essential Habitat mapping provided by EHP (2017d)
- Protected Plants Flora Survey Trigger mapping provided by EHP (2016a)
- The National Red Imported Fire Ant Eradication Program: Fire and biosecurity zones mapping provided by the Department of Agriculture and Fisheries (DAF) (March 2017) (DAF 2016b)
- Brisbane Airport Fauna Study (Lambert & Rehbein 2004)
- Chapter B5, New Parallel Runway Environmental Impact Statement (EIS)/MDP (BAC 2006)

6.2.2 Field survey

6.2.2.1 General

A fauna and flora assessment within the Project site was undertaken by a qualified senior ecologist and an environmental scientist on 6 March 2017, as indicated in Table 6.1.

Table 6.1 **Suitably qualified personnel**

Name	Qualification	Experience
Dr Chris Schell (Senior Ecologist)	PhD Bachelor of Applied Science (Honours)	15 years
Georgina Kerr (Environmental Scientist)	Bachelor of Science (Environment) (Honours)	6 years

6.2.2.2 Flora

The flora assessment within the Project site included the following activities:

- Verify the extent, floristic structure and composition of vegetation communities
- Verify the mapping and classification of REs and Regrowth Vegetation
- Search for conservation significant plant species
- Identify the ecological values associated with the vegetation of the Project site

Given that the Project site is located outside of a "high risk area" as indicated on the Protected Plant Flora Survey Trigger Mapping (EHP 2016a), flora survey techniques as identified in the *Flora Survey Guidelines – Protected Pants Nature Conservation Act 1992* (EHP 2016b) were not required. However, to assess the diversity of flora species located within the Project site, random meander sampling (prescribed by Cropper 1993) was undertaken, listing all vascular flora species encountered. This included areas of disturbance and areas considered to support the highest habitat values. A broader sweep of individual communities was also undertaken to identify any significant flora species, and further refine community definitions.

The flora survey was conducted continuously during field investigations, to provide an incidental list of flora species present. Plant identifications were carried out utilising available flora and botanical reference material, where necessary.

6.2.2.3 Fauna

The fauna survey undertaken within the Project site included the following:

- Targeted searches for conservation significant fauna species and associated critical habitats (ie Wallum Froglet (*Crinia tinnula*)
- Incidental records of fauna species encountered

The random meander survey technique was adopted for all identified habitat types. Fauna species observed within or flying over the Project site during the fauna survey were identified to species level, where possible.

Fauna species within the Project site were identified through direct observation and/or vocal calls.

6.2.2.4 Habitat

Habitats within the Project site were assessed to determine their value for native flora and fauna species. The assessment focussed on identifying habitat features associated with conservation significant species. Particular attention was paid to habitat features including:

- Mangrove and tidal habitats
- The presence of mature trees with hollows
- Fissures and/or other suitable roosting/nesting places
- Areas of dense vegetation and leaf litter
- The presence of Koala (*Phascolarctos cinereus*) food trees
- Areas of dense vegetation and leaf litter
- Presence of hollow logs/debris

- Presence of fruiting/blooming flora species
- Vegetation connectivity and proximity to neighbouring areas of intact vegetation

6.2.2.5 Survey limitations

It should be noted that the detectability of plants and the ability to accurately identify plants to species level may vary greatly with the time of year, prevailing climate conditions, and the presence of reproductive material (flowers, fruit, seed capsules). However, every reasonable effort has been made to detect and accurately identify all such species.

Fauna surveys are also subject to inherent limitations in the detection success of target species. These limitations often result in a degree of false-absence records (a species is present, but not detected). It is therefore important that the fauna survey limitations are identified, and the fauna survey results are viewed with these constraints in mind. The limitations to the fauna surveys conducted include:

- The survey period not coinciding with the period that some migratory or nomadic species occur in the locality
- Species with a large home range (eg owls, raptors etc) not present at the time of survey
- The difficulty in detecting certain species during the survey period (ie cryptic species, species present within the survey location at very low densities etc)
- Biological features such as sex, age-class, and breeding biology that may influence habitat use and detectability during different times of the year
- The lack of suitable climatic conditions necessary for the presence and/or detectability of certain species (eg amphibians following heavy rainfall)

Consequently, the results of the flora survey should not be regarded as conclusive evidence that certain conservation significant flora species do not occur within the Project site. However, every reasonable effort has been made to detect and accurately identify all such species, given the disturbed nature of the site.

6.3 Existing environment

6.3.1 Desktop review

6.3.1.1 Regional Ecosystems

Analysis of the EHP RE mapping for the Project site (refer Appendix C) indicates that three REs are present within the south-western portion of the Project site. The following REs are mapped as occurring on site: RE12.1.3, RE12.3.6 and RE12.3.5a. These REs are described in Table 6.2 below.

Table 6.2 Regional Ecosystems identified within the Project site

Regional Ecosystem	Management status		Description (adapted from the RE Description Database)
	VM Act status	Biodiversity status	
12.1.3	Least concern	No concern at present	Mangrove shrubland to low closed forest. Occurs on Quaternary estuarine deposits
12.3.6	Least concern	No concern at present	*Melaleuca quinquenervia* +/- *Eucalyptus tereticornis, Lophostemon suaveolens, Corymbia intermedia* open forest to woodland with a grassy ground layer dominated by species such as *Imperata cylindrica*. *Eucalyptus tereticornis* may be present as an emergent layer. *Eucalyptus seeana* may also occur in this ecosystem to the south and east of Brisbane. Occurs on Quaternary floodplains and fringing drainage lines in coastal areas

Regional Ecosystem	Management status		Description (adapted from the RE Description Database)
	VM Act status	Biodiversity status	
12.3.5a	Least concern	No concern at present	*Melaleuca quinquenervia, Casuarina glauca* +/- *Eucalyptus tereticornis, E. siderophloia* open forest. Occurs on lowest terraces of Quaternary alluvial plains in coastal areas. Palustrine wetland **Note:** This RE has been identified as providing Essential Habitat for the Wallum froglet (*Crinia tinnula*) within the Project site.

Table note:
VM Act = *Vegetation Management Act 1999* (Qld)

6.3.1.2 Essential Habitat

Analysis of the EHP Essential Habitat mapping for the Project site (refer Appendix C) indicates that essential habitat associated with a single species (ie Wallum froglet (*Crinia tinnula*)) is located within the Project site, in association with RE 12.3.5a. A description of RE 12.3.5a is provided in Table 6.2 and a description of the essential habitat mapped within the Project site is provided in Table 6.3 below.

Table 6.3 Essential habitat identified within the Project site

Essential habitat code	Scientific name	Common name	Conservation status of species (NC Act)	Vegetation community
686	*Crinia tinnula*	Wallum froglet	Vulnerable	Vegetation community is a mandatory essential habitat factor for this species. Permanent to ephemeral acidic (pH 4.3 - 5.2), soft freshwater in Melaleuca (eg *M. quinquenervia*) swamps, sedgeland, wet and dry heathland (eg *Banksia robur*, *Xanthorrhoea* sp.) and wallum (*Banksia aemula* shrubland/woodland) areas coastal lowlands on sand or sandstone, occasionally in adjacent open forest/woodland (eg *Eucalyptus racemosa, Corymbia citriodora*) with heathy understorey; known to persist in small remnants (<10ha); may be found well away from water.

6.3.1.3 Flora

Analysis of State and Commonwealth databases indicates that nine conservation significant flora species have been identified, or have the potential to occur, within 3 km of the Project site. These species are listed in Table 6.4 below. An assessment of the likelihood of occurrence for these species was conducted and it was determined that no conservation significant flora species were likely to occur within the Project site. The assessment of the likelihood of occurrence of these species is provided in Appendix H.

Table 6.4 Conservation significant flora species identified as potentially occurring within the Project site

Scientific name	Common name	Conservation status		Source of record
		NC Act	EPBC Act	
Arthraxon hispidus	Hairy-joint Grass	Vulnerable	Vulnerable	EPBC Protected Matters Search
Bosistoa transversa	Three-leaved Bosistoa, Yellow Satinheart	Least concern	Vulnerable	EPBC Protected Matters Search
Cryptocarya foetida	Stinking Cryptocarya, Stinking Laurel	Vulnerable	Vulnerable	EPBC Protected Matters Search
Dichanthium setosum	Bluegrass	Least concern	Vulnerable	EPBC Protected Matters Search

Scientific name	Common name	Conservation status		Source of record
		NC Act	EPBC Act	
Macadamia integrifolia	Macadamia Nut, Queensland Nut Tree, Smooth-shelled Macadamia, Bush Nut, Nut Oak	Vulnerable	Vulnerable	EPBC Protected Matters Search
Macadamia tetraphylla	Rough-shelled Bush Nut, Macadamia Nut, Rough-shelled Macadamia, Rough-leaved Queensland Nut	Vulnerable	Vulnerable	EPBC Protected Matters Search
Phaius australis	Lesser Swamp-orchid	Endangered	Endangered	EPBC Protected Matters Search
Samadera bidwillii	Quassia	Vulnerable	Vulnerable	EPBC Protected Matters Search
Thesium australe	Austral Toadflax, Toadflax	Vulnerable	Vulnerable	EPBC Protected Matters Search

6.3.1.4 Fauna

Analysis of State and Commonwealth databases indicates that 24 conservation significant fauna species have been identified, or have the potential to occur, within 3 km of the Project site. These species are listed in Table 6.5 below. An assessment of the likelihood of occurrence for these species was conducted and it was determined that no conservation significant fauna species were likely to occur within the Project site. The assessment of the likelihood of occurrence of these species is provided in Appendix H.

Table 6.5 Conservation significant fauna species identified as potentially occurring within the Project site

Scientific Name	Common Name	Conservation status		Source of record
		NC Act	EPBC Act	
Birds				
Anthochaera phrygia	Regent honeyeater	Endangered	Critically endangered	EPBC Protected Matters Search
Botaurus poiciloptilus	Australasian bittern	Least concern	Endangered	EPBC Protected Matters Search

Chalinolobus dwyeri	Large-eared Pied Bat, Large Pied Bat	Vulnerable	Vulnerable	EPBC Protected Matters Search
Dasyurus hallucatus	Northern Quoll, Digul	Least concern	Vulnerable	EPBC Protected Matters Search
Dasyurus maculatus maculatus (SE mainland population)	Spot-tailed quoll, Spotted-tail quoll, Tiger quoll (south-eastern mainland population)	Vulnerable	Endangered	EPBC Protected Matters Search
Petauroides volans	Greater glider	Least concern	Vulnerable	EPBC Protected Matters Search
Phascolarctos cinereus	Koala	Vulnerable	Vulnerable	Wildlife Online, EPBC Protected Matters Search
Pteropus poliocephalus	Grey-headed flying-fox	Least concern	Vulnerable	Wildlife Online, EPBC Protected Matters Search
Xeromys myoides	Water mouse, False water rat, Yirrkoo	Vulnerable	Vulnerable	EPBC Protected Matters Search

6.3.2 Site based assessment

6.3.2.1 Flora

6.3.2.1.1 Regional Ecosystems

As indicated in Section 6.3.1, three REs have been identified as potentially occurring within the Project site. Site investigations indicate that only a single RE (ie RE 12.1.3) is present within the Project site.

Areas currently mapped as RE 12.3.6 and 12.3.5a on the EHP certified RE map contained neither the species diversity nor abundance that would render them eligible for mapping as a RE. Areas mapped as RE 12.3.6 and 12.3.5a were found to be dominated by Swamp oak (*Casuarina glauca*) which is typical of areas subject to historic planting of the species at this location. In addition, modification of the land surface into furrows (refer Photo 6.1) confirms that trees within areas mapped as RE 12.3.6 and RE 12.3.5a have been planted.

Photo 6.1 Vegetation contained within areas mapped as Remnant RE 12.3.5a and 12.3.6

6.3.2.1.2 Vegetation communities

Four broad vegetation communities (refer Figure 6.1) have been identified as occurring within the Project site, including:

- Community 1: *Casuarina glauca* plantation (non-remnant)
- Community 2: Grassland with isolated trees (non-remnant)
- Community 3: Mangrove (primarily *Avicenna marina*) tidal community (non-remnant and RE 12.1.3)
- Community 4: Marine wetland with isolated mangroves (non-remnant and RE 12.1.3)

With the exception of Community 2, all vegetation communities identified on site contain species considered to be marine. This has resulted from marine hydrological processes and dispersal of marine flora seeds with tidal flows and historic plantings (ie establishment of *Casuarina glauca* on site).

While the Project site is not located in a Wetland Protection Area, as defined under the EP Reg and the *State Development Assessment Provisions, Module 11: Wetlands and wild rivers*, a portion of the Project site (on the north west boundary) is mapped as a wetland of High Ecological Significance (refer Appendix C). While field investigations have confirmed that a portion of the Project site exhibits the characteristics of a wetland, the Project site is located within a highly modified area with existing and future development proposed under the Brisbane Airport 2014 Master Plan. In addition, appropriate mitigation measures will be implemented to reduce any potential impacts on the receiving environment (refer Section 6.5).

A brief description of the dominant species assemblages encountered within each vegetation community is provided in Table 6.6. A flora species list for the Project site is included in Appendix I.

Table 6.6 Vegetation communities

Vegetation community	Description	Photograph
Vegetation community 1 – *Casuarina glauca* plantation	This vegetation community dominates most of the Project site. Swamp She-oak (*Casuarina glauca*) dominates the canopy stratum (18 – 20 m). These species have been planted in rows over the majority of the Project site. A sub-canopy is absent within this community, however, a clearly defined shrub stratum of Lantana (*Lantana camara*) occurs, with an average height of 1 – 3 m and an approximate cover of 70%. The ground cover in this community contains exotic grasses such as Elastic grass (*Eragrostis tenuifolia*), Couch grass (*Cynodon dactylon*) and Salt couch (Sporobolus virginicus), Rhodes grass (*Chloris gayana*), Green panic (*Megathyrsus maximus*), Red natal grass (*Melinis repens*) and Common reed (*Phragmites australis*), particularly in areas subject to tidal inundation.	

Vegetation community	Description	Photograph
Vegetation community 2 - Grassland with isolated trees	Vegetation Community 2 is largely devoid of canopy and shrub specie as a result from historic clearing activities. Although little structural complexity exists in the form of an upper, or shrub stratum, dense grass grown has resulted in a structurally complex ground stratum in areas that have not been subject to recent slashing. In areas that are maintained (ie regularly slashed) structural complexity of the ground stratum is relatively poor. The ground stratum within this area is dominated by exotic species including Elastic grass (*Eragrostis tenuifolia*), Couch grass (*Cynodon dactylon*), Rhodes grass (*Chloris gayana*), Green panic (*Megathyrsus maximus*) and Red natal grass (*Melinis repens*). A small area to the north east, adjacent to the marine wetland with mangroves appears to be an artificial wetland. The area is dominated by Broad-leaved cumbungi (*Typha orientalis*), Common reed (*Phragmites australis*) and other freshwater aquatic macrophytes such as Reeds (*Baumea* spp) and *Persicaria* spp. Due to the dense vegetation, this area provides good habitat for cryptic bird species such as Lewin's rail (*Lewinia pectoralis*), Australian painted snipe (*Rostratula australis*) and the Australasian Bittern (*Botaurus poiciloptilus)*.	

Vegetation community	Description	Photograph
Vegetation community 3 – Mangrove (*Avicennia marina*) tidal community	Vegetation Community 3 is located in the middle of the site and follows the Grey mangroves (*Avicennia marina*) tidal creek line across the site. Grey Mangroves (*Avicennia marina*) dominate the canopy stratum (85% cover) with a height of approximately 18 – 20 m. The sub-canopy was also dominated by Grey mangroves which approximated 3 – 5 m in height and 10% cover. Along the drainage lines, Yellow mangroves (*Ceriops tagal*) dominated the understory, forming thickets approximating 1-2 m in height and a cover of 40%. The ground stratum within this vegetation community was dominated by Salt couch (*Sporobolus virginicus*) although other salt tolerant species such as *Tetragonia tetragonoides* (New Zealand spinach), *Einadia hastate* (Berry saltbush), *Enchylaena tomentosa* (Ruby saltbush) and *Suaeda arbusculoides* (Jelly-bean plant) were also present Spring tides are expected to inundate areas of this vegetation community several times a year. Accordingly, this vegetation community is defined as a Wetland under the definition provided in the *Strategy for Conservation and Management for Queensland's Wetlands* (EHP 2009): *"areas of permanent or periodic/intermittent inundation, whether natural or artificial, with water that is static or flowing, fresh, brackish or salt, including areas of marine water the depth of which at low tide does not exceed 6 m".* This area is typical of a vegetation community that constitutes a marine area under the provisions of the Fisheries Act.	

Vegetation community	Description	Photograph
Vegetation community 4 – Marine wetland with mangroves	Vegetation Community 4 are two small pockets of vegetation located in southern portion of the site. The vegetation community is dominated by marine species including the Grey mangrove (*Avicenna marina*) and Swamp she-oak (*Casuarina glauca*) with large areas containing open water largely devoid of terrestrial vegetation. The ground stratum within this vegetation community, surrounding marine waters was dominated by Salt couch (*Sporobolus virginicus*) although other salt tolerant species such as *Tetragonia tetragonoides* (New Zealand spinach), *Einadia hastate* (Berry saltbush), *Enchylaena tomentosa* (Ruby saltbush) and *Suaeda arbusculoides* (Jelly-bean plant). This area is typical of a vegetation community that constitutes a marine area under the provisions of the Fisheries Act.	

6.3.2.1.3 Species diversity and conservation significant species

In total, 67 flora species were identified within the Project site, with 36 native flora species (53.7%). Nine flora species are considered to be obligatory marine species (eg grey and yellow mangroves). However, no conservation significant flora species, as listed under the provisions of the NC Act and/or the EPBC Act, were identified within the Project site. A complete list of flora species identified within the Project site is provided in Appendix I.

A likelihood of assessment was undertaken for conservation significant species potentially occurring within the Project site (refer Appendix H). Based on this assessment, it is considered unlikely that any conservation significant flora species (as identified within Table 6.4) occur within the Project site (refer Appendix H).

6.3.2.1.4 Weeds

No Weeds of National Significance (WoNS; as listed under the provisions of the EPBC Act) were detected within the Project site during field investigations. Eight weeds listed under Schedule 2 of the Biosecurity Act were recorded within the Project site (refer Table 6.7). Numerous other weed species which are not declared under Commonwealth or State legislation, but are generally considered to be environmental weeds also occur within the Project site (refer Appendix I).

Table 6.7 Environmental weeds recorded within the Project site

Botanical name	Common name	EPBC WoNS	Biosecurity Act
Ambrosia artemisiifolia	Annual ragweed	×	Schedule 2
Asparagus aethiopicu	Basket asparagus fern	✓	Schedule 2
Asparagus plumosus	Feathered asparagus fern	✓	Schedule 2
Baccharis halimifolia	Groundsel bush	×	Schedule 2
Celtis sinensis	Chinese elm	×	Schedule 2
Dolichandra unguis-cati	Cat's claw creeper	✓	Schedule 2
Lantana camara	Lantana	✓	Schedule 2
Schinus terebinthifolius	Broadleaf pepper tree	×	Schedule 2

6.3.2.2 Fauna

6.3.2.2.1 Fauna species observed on site

Fifteen fauna species were recorded during field investigations of the Project site. Of these species, 14 were birds and one was a reptile. No mammals or amphibians were observed. With the exception of one species (ie Rainbow bee-eater *Merops ornatus*), all species observed as listed are least concern species under the provisions of the NC Act. A complete list of all fauna observed during the field survey is provided in Appendix I.

6.3.2.2.2 Conservation significant species

A review of environmental databases identified 24 conservation significant fauna species (listed under the provisions of the EPBC Act and NC Act) as potentially occurring within 3 km of the Project site (refer Appendix I). In addition to these species, correspondence with BAC and a previous fauna study (Lambert & Rehbein 2004) has indicated that Illidge's ant-blue butterfly (*Acrodipsas illidgei*), listed as Vulnerable under the NC Act, has potential to occur within the Project site, although it is noted that this species was not returned as part of the desktop review (ie not included within the Wildlife online records).

One Special Least Concern bird species (Rainbow bee-eater) as listed under the NC Act and listed as Marine under the provisions of the EPBC Act was observed during field investigations of the Project site. No other conservation significant fauna species were identified during the incidental fauna survey. Despite this, the likelihood of their occurrence within the Project site was assessed based on the suitability of habitat present (refer Appendix H). Given the geographic location of the Project site, entirely marine and/or pelagic species have been omitted from this assessment.

Based on the likelihood of occurrence assessment (refer Appendix H), the following conservation significant species have potential to occur within the Project site:

- Australasian bittern (*Botaurus poiciloptilus*)
- Red knot (*Calidris canutus*)
- Western Alaskan bar-tailed godwit (*Limosa lapponica baueri*)
- Eastern curlew (*Numenius madagascariensis*)
- Australian painted snipe (*Rostratula australis*)
- Grey-headed flying-fox (*Pteropus poliocephalus*)
- Water mouse (*Xeromys myoides*)

In addition, suitable habitat in the form of mature mangroves exists on site for the Illidge's ant-blue butterfly (*Acrodipsas illidgei*).

All species identified as having potential to occur within the Project site are associated with marine wetlands or mangrove communities and environments directly associated with wetlands (ie grassy areas).

6.3.2.2.3 Pests

No fauna species declared under the *Biosecurity Act 2014* were recorded in the Project site during field investigations.

According to the Fire ant biosecurity map (DAF 2016), the Project site is located within Fire ant biosecurity zone 3. As such, there are restrictions on fire ant carriers (eg soil, mulch, turf, potted plants etc) movements. Under the *Biosecurity Act 2014*, all individuals and organisations have a general biosecurity obligation to take all reasonable steps to ensure they do not spread fire ants.

6.3.2.2.4 Habitat values

The Project site and its surrounds are considered to be highly disturbed and modified environments, which has resulted in habitat fragmentation and a reduction in the quantity and quality of fauna habitat resources. Despite this, tidal inundation within the Project site facilitates the formation of food-rich environments for fish, crabs, molluscs and birds that utilise marine wetlands.

Mangroves typically provide large amounts of organic matter, which is consumed by many small aquatic animals. Subsequently, these animals are consumed by larger fish and other animals.

Spring tides are expected to effect a portion of the Project site several times a year. During this time, salt couch provides suitable shelter for fish and invertebrates, and foraging opportunities for wader birds.

A portion of the Project site is mapped as Essential Habitat for Wallum froglet (*Crinia tinnula*) (refer Appendix C). This mapping is noted as being erroneous as habitat for this species does not exist within the Project site. Further, the Wallum froglet is not a salt tolerant species and therefore is not expected to occur at this location.

Existing habitat within the Project site is considered fragmented in the regional landscape as a result of historical agricultural land use, planting activities, existing airport infrastructure, and current airport operations. Mangrove communities, associated with the Project site's artificial drainage systems, offer limited fauna movement opportunities to small coastal habitats to the east of the Project site and it is expected that only highly agile species (eg birds) are likely to utilise the Project site.

6.4 Potential impacts

The Project has potential to impact on the habitat and native biodiversity of the Project site. Potential impacts associated with the Project are discussed in the following sections.

6.4.1 Flora

As discussed in Section 6.3.2.1, there are no significant flora species identified within the Project site. Therefore, it is considered that the Project will not have any adverse consequences to significant flora as per clause 4.04 of the AEPR.

Removal of vegetation within the Project site is not expected to result in regional or sub-regional affects to the conservation status of any conservation significant flora species.

Mangroves and salt couch are considered marine plants under the provisions of the Fisheries Act. Marine plants are an integral feature of coastal environments that provide food-rich environments for fish, crabs, molluscs and birds. Disturbances to marine plants, even of a minor nature, can lead to a long term decline in fish production and overall aquatic health. However, the current fragmented and disturbed nature of the Project site provides limited habitat value and, combined with the absence of conservation significant species, it is considered that removal of these marine plants will not constitute a significant impact. In addition, mitigation measures will ensure that potential impacts to the receiving environment associated with removal of marine plants are minimised.

The machinery and equipment used during the construction phase may facilitate the proliferation of weed species to adjacent areas, if control measures are not appropriately implemented to avoid dispersal of seeds. Weeds declared under the provisions of the Biosecurity Act were identified on site. These weeds will be destroyed as part of the Project to prevent proliferation of these weeds in areas adjacent the Project site that might otherwise occur if left unattended.

Dust generation, resulting from construction earthworks (ie vegetation clearing, traffic movement over bare surfaces, and rock crushing activities), has the potential to impact upon neighbouring mangroves and other native vegetation. Dust accumulation has the potential to adversely affect the photosynthetic processes of vegetation by reducing the leaves' exposure to direct sunlight, and by causing blockages of the leaf stomata, thereby preventing adequate uptake of oxygen and carbon dioxide, causing an overall decline in plant health. Dust suppression measures during the construction phase will be important to minimising the impact to vegetation and are discussed in Section 8.

6.4.2 Fauna

As discussed in Section 6.3.2.2, there were no conservation significant fauna species identified within the Project site. Therefore, it is considered that the Project will not have any adverse consequences to significant fauna as per clause 4.04 of the AEPR.

Removal of fauna habitat within the Project site is not expected to result in regional or sub-regional affects to the conservation status of any conservation significant fauna species.

The removal of marine plants (mangroves and salt couch), in particular, can lead to a long term decline in fish production and overall aquatic health. Furthermore, clearing activities may lead to significant fish losses and decline in water quality, if appropriate mitigation measures for ASS are not implemented. Mitigation measures will be implemented in order to minimise the impact associated with fauna habitat removal.

Direct fauna mortality has the potential to occur within the construction phase of the Project as a result of vegetation clearing, potential ASS exposure and runoff. Mitigation measures (including those outlined in Section 6.5) will be required in order to minimise the risk of direct fauna mortality.

Fauna mortality could also potentially occur to marine species during filling of existing drains. This includes fish, crabs and molluscs which may be unable to relocate from the drains to be filled without assistance. Mitigation measures have been provided in Section 6.5 to assist with the management of this potential impact.

Introduction and encouragement of pest fauna species (under the provisions of the EPBC Act and Biosecurity Act) is considered possible during the construction phase of the Project. However, mitigation measures will be implemented in order to decrease the likelihood of proliferation.

As discussed in Section 6.3.2.2.4, mangrove communities (associated with the Project site's manmade drainage systems) offer limited fauna movement opportunities, by forming linkages to small coastal habitats to the east of the Project site. Potential impacts to fauna movement corridors are considered negligible, as a result of the fragmented nature of the broader landscape resulting from historic and present land use.

Displacement of fauna within, and adjacent to, the Project site is expected as a result of noise and possible artificial lighting during the construction phase. However, given the proximity of the Project site to the Brisbane Airport, and the exposure of noise generated from the flight path, it is likely that local bird populations are familiar with artificial lighting and high levels of background noise. As such, artificial lighting and noise are not considered to pose a significant impact to fauna within the vicinity of the Project site.

Dust is expected to be generated as a result of construction earthworks (ie vegetation clearing, traffic movement over bare surfaces, rock crushing activities, and stock piling). Dust impacts on fauna that forage on mangrove leaves (eg invertebrates) are not well known, however, the risks associated with dust deposition are considered to be negligible provided that appropriate dust suppression measures are applied.

6.5 Mitigation measures

Table 6.8 provides recommended management measures to mitigate the potential impacts identified above.

Table 6.8 Flora and fauna potential impacts and mitigation measures

Potential environmental aspect/impact	Management objective	Action	Phase to be implemented	Outcome
Loss of native vegetation				
Removal of marine plants listed under the provisions of the Fisheries Act resulting in possible decline in fish production and overall aquatic health Removal of native vegetation protected under the provisions of the NC Act Clearing of trees (ie mangroves) that provide habitat values for terrestrial and aquatic species Decrease in floral diversity within the Project site as a result of clearing activities Loss of native vegetation caused by clearing beyond that which is required for construction	The lawful clearing of native vegetation (particularly marine plants) will be offset within the Brisbane Airport's Biodiversity Zone Implement control measures to ensure that clearing limits during construction are clearly identified and adhered to	■ Ensure all necessary permits/approvals are in place before construction commences ■ The Contractor shall ensure vegetation for retention (including on adjacent land) is protected by exclusion fences in appropriate locations ■ The exact location of vegetation to be retained shall be verified on site in consultation with the BAC Environmental Advisor	Detailed design and construction	Vegetation to be retained is protected from damage/ destruction. Requirement to be included in the EMP.

Potential environmental aspect/impact	Management objective	Action	Phase to be implemented	Outcome
Impact on flora and fauna as a result of ASS exposure				
Acidification of waterways, wetlands, and estuaries which leads to fish kills Degradation of ecology through loss of water quality, degradation of habitat and decline in dependent ecosystems Negative impact on macrophytes and other aquatic vegetation that aquatic animals depend on for food, shelter and reproduction. Potential impact on downstream habitats for various waterbirds, including federally listed migratory species and those listed under international agreements	Avoid disturbance of ASS Construction activities do not result in the exposure of ASS	■ All site works are to be conducted in accordance with the ASS Management Plan (refer Appendix F)	Detailed design and construction	Requirement to be included in the EMP

Potential environmental aspect/impact	Management objective	Action	Phase to be implemented	Outcome
Introduction and proliferation of pest and weed species				
Proliferation of pest and weed species within and adjacent to the Project site Beneficial removal of weeds and pests from the Project site	There are no net increase in declared weeds and pests within the Project site and surrounding environments as a result of construction activities	The Contractor shall prepare and implement a pest and weed management plan as part of the CEMP, incorporating the following measures: ■ Ensure that declared species are removed in accordance with the EPBC Act and Biosecurity Act requirements, and the material disposed of in a manner that ensures proliferation does not occur – appropriate measures may include weed treatment prior to construction works, disposal at a green waste facility, while ensuring it is transported safely, buried or added to on site mulching ■ Report suspected outbreaks of declared weed species to the BAC Environmental Advisor ■ Report sightings of declared pest animals (as listed under the provisions of the EPBC Act and NC Act) to the BAC Environmental Advisor and implement appropriate management measures ■ Do not deliberately introduce declared weed and/or pest species as listed under the provisions of the EPBC Act and/or Biosecurity Act ■ Implement measures to ensure that all plant and materials brought into the Project site are certified free of declared pests ■ Implement waste management measures to avoid increased abundance of pests and opportunistic native fauna ■ Any excess fill leaving Brisbane Airport and 'Fire ant biosecurity Zone 3' must be accompanied by a biosecurity instrument permit from DAF	Detailed design and construction	Requirement to be included in the EMP

Potential environmental aspect/impact	Management objective	Action	Phase to be implemented	Outcome
Loss of fauna and/or habitat				
Unnecessary clearing of fauna habitat within the Project site Net loss of fauna habitat area, quality, and diversity, within the broader region Unnecessary clearing of fauna habitat Unnecessary removal/ displacement/ translocation of fauna species Fauna injury/death as a result of construction activities Adjoining habitat is adversely affected by secondary impacts	Aim to minimise net loss of habitat area, quality and diversity within the broader region where practicable Avoid fauna injury and/or death resulting from construction activities Ensure that secondary impacts associated with the proposed development are considered, and avoided, where possible	Staged and sequential clearing measures shall be implemented to enable fauna to disperse to adjoining habitats. Implement the fauna management measures provided in the EMP, which includes, but is not limited to the following: ■ A pre-clearing habitat assessment is to be conducted by a licenced and suitably qualified spotter catcher immediately prior to construction works commencing. The spotter catcher shall remain on call during all vegetation clearing activities ■ All native wildlife (including snakes) are protected and shall not be intentionally harmed as a result of works or workers' actions ■ Relocate potential habitat features (eg hollow logs) to adjacent areas if identified by the fauna spotter catcher ■ Outline procedures to be undertaken if an animal (healthy or injured) is encountered during construction ■ Check culverts, trenches and other excavations (that have been constructed in accordance with the ASS Management Plan) for fauna species (to be checked each morning and after periods of inactivity to ensure no animal is trapped or likely to be harmed by construction activities) ■ Install trench ramps at 15 degree slopes every 30 m or place branches or suitable material for fauna to climb and escape from trenches ■ Workers are to be made aware of fauna management on site during the site induction ■ Include details of fauna protection measures in the site induction for all construction personnel ■ Contact the BAC Environmental Advisor in the event that an animal is injured during construction, followed by 1300 Animal (1300 264 625)	Detailed design and construction	Requirement to be included in the EMP
		■ The Contractor shall implement actions recommended in all other sections of this EAR relevant to the following: – Erosion and sediment control – Water quality management – Waste management – Adhere to the mitigation measures stipulated in the ASS Management Plan		

Potential environmental aspect/impact	Management objective	Action	Phase to be implemented	Outcome
Marine fauna death as a result of the filling and realignment of existing drains	Ensure marine fauna within the drains to be filled are appropriately relocated	All external drains are to be bunded to prevent tidal ingress. Drains to be filled should be filled during low or no flow condition using the following sequence of works: 1) Construct the new section of the drain, where required 2) Install marine fauna exclusion fencing upstream and downstream of the sections of drain to be filled prior to marine fauna load reduction trapping to prevent re-entry of marine fauna into the section of drain to be filled 3) A suitably qualified spotter catcher should undertake pre-realignment marine fauna load reduction trapping within the section of the drain to be filled 4) Captured marine fauna should be relocated to another section of the drain not being impacted by the works 5) Undertake drain alignment change over at low tide, where required 6) Undertake a post-realignment spotter catcher survey and relocate any remaining fauna, where required It should be noted that experience during previous projects involving the realignment of drains has identified a large number of fauna within the existing drain to be realigned. The Contractor is to ensure they have a suitable number of spotter catchers on site to undertake the work successfully.	Construction	Requirement to be included in the EMP
Impact of dust on the health of vegetation				
Dust deposition on adjacent vegetation during construction activities (vegetation clearing, traffic movement over bare surfaces, rock crushing activities, and stock piling)	Ensure the health of adjacent vegetation communities are not affected by dust generated during construction	Manage dust in accordance with the mitigation measures identified in Section 8.7	Detailed design and construction	Requirement to be included in the EMP
Noise				
Generation of both intermittent and continuous loud noise as a result of construction activities	Minimise the effects of excessive noise on fauna, where possible	Manage noise in accordance with the measures identified in Section 9.6	Detailed design and construction	Requirements to be included in the EMP

Potential environmental aspect/impact	Management objective	Action	Phase to be implemented	Outcome
Lighting				
Generation of additional lighting during construction of the Project	Minimise the effects of lighting on fauna in and adjacent to the Project site	Position lighting, and use light fittings which will results in the minimal dispersion of light (eg LED lighting) outside of the Project site during construction while ensuring that it is consistent with aviation safety requirements discussed in Section 13.6 Avoid the use of mercury lamps, where possible, as these have a tendency to attract fauna, particularly insects	Detailed design and construction	Requirements to be included in the EMP

7 Hydrology and water quality

7.1 Introduction

This section provides a summary of the hydrology (surface water) and hydrogeology (groundwater) water quality issues associated with the Project.

7.2 Methodology

A desktop review of the Project information and data as well as current legislation, guidelines and water quality objectives that apply to the construction of the Project has been undertaken. A review of the existing surface water and groundwater quality is provided. This has been used to provide an indication of the baseline quality of the environment from which potential impacts from the construction and operation of the Project were able to be identified. Mitigation measures addressing the identified potential impacts have been recommended in Section 7.6.

7.3 Relevant documents

7.3.1 Airports (Environment Protection) Regulations 1997

Schedule 2 of the AEPR lists the acceptable limits of various physical-chemical, nutrients, metals and biological parameters. These limits assist in assessing the baseline water quality for the Project site.

7.3.2 Environmental Protection (Water) Policy 2009

Under the EPP (Water), EHP has developed environmental values (EVs) and water quality objectives (WQOs) for the surface water in the areas surrounding the Project site. The purpose of the EPP (Water) is to identify EVs and develop management goals to assess whether EVs are maintained. The EVs and WQOs are detailed in the following documents:

- Environmental Protection (Water) Policy 2009, Brisbane Creeks – Bramble Bay environmental values and water quality objectives No. 142 (part), including Bald Hills, Cabbage Tree, Downfall, Kedron Brook, Nudgee and Nundah creeks (Department of Environment and Resource Management (DERM) 2010a)
- Environmental Protection (Water) Policy 2009, South-east Queensland Map Series PLAN WQ1423 (DERM 2010b)

The catchment is subdivided into a number of sub catchment waterways and the most relevant to the Project site is **Kedron Brook Floodway.** Existing drainage channels on the Project site all flow to Landers Pocket Drain, which discharges to Kedron Brook Floodway.

The identified EV for the Kedron Brook Floodway, as defined in Figure 7.2, are aquatic ecosystems, secondary recreation, visual recreation and cultural and spiritual values.

Water	Environmental values [1, 2, 3, 4]											
	Aquatic ecosystems	Irrigation	Farm Supply/use	Stock water	Aquaculture	Human consumer	Primary recreation	Secondary recreation	Visual recreation	Drinking water	Industrial use	Cultural and spiritual values
Cabbage Tree Creek - including Little Cabbage Tree Creek - freshwater	✓	✓		✓			✓	✓	✓			✓
Cabbage Tree Creek – estuarine and enclosed coastal	✓					✓	✓	✓	✓			✓
Jubilee Creek – estuarine and enclosed coastal	✓							✓	✓			✓
Kedron Brook – Cedar Creek - in Brisbane Forest Park - freshwater	✓						✓	✓	✓			✓
Kedron Brook – Cedar Creek - downstream of Brisbane Forest Park - freshwater	✓	✓		✓			✓	✓	✓			✓
Kedron Brook – Urban reach – including Sandy Creek - freshwater	✓							✓	✓			✓
Kedron Brook – Schultz Canal - freshwater	✓							✓	✓			✓
Kedron Brook – Schultz Canal - estuarine	✓							✓	✓			✓
Kedron Brook – Pound Drain and Cannery Creek - freshwater	✓							✓	✓			✓
Kedron Brook Floodway – including Boondall Wetlands – estuarine and enclosed coastal	✓							✓	✓			✓
Nudgee Creek – estuarine and enclosed coastal	✓					✓		✓	✓			✓

Figure 7.2 EPP environmental values

The WQOs relevant to the Kedron Brook Floodway (tidal canals, constructed estuaries, marinas and boat harbours) to protect aquatic ecosystem EVs include:

- Turbidity: <8 NTU
- Suspended solids: <20 mg/l
- Chlorophyll a: <4 µg/l
- Total nitrogen: <300 µg/l
- Oxidised N: <10 µg/l
- Ammonia N: <10 µg/l
- Organic N: <280 µg/l
- Total phosphorus: <25 µg/l
- Filterable reactive phosphorus: <6 µg/l
- Dissolved oxygen: 85 – 105% saturation
- pH: 7.0 – 8.4
- Secchi depth: >1.0 m

7.3.3 Construction Environmental Management Plan (CEMP) Guidelines

During the construction phase, WQOs are defined by the CEMP Guidelines (BAC 2014d). These WQOs are applicable to discharges from the perimeter drain or any other discharges from the Project site during construction and are summarised in Table 7.1.

Table 7.1 Water quality objectives from CEMP Guidelines

Parameter	Water quality target for rivers	Water quality target for lakes	Water quality target for estuaries	Water quality target for coastal waters
pH	6.5-9.0	6.5-9.0	<0.2 pH unit rise	<0.2 pH unit rise
Total suspended solids (TSS)[1]	<10% increase from the seasonal mean TSS			
Dissolved oxygen (DO)	DO must be greater than 6 mg/l or 80% saturation for a normal 24 hour period			
Temperature	Temperature of receiving water must not rise more than 2°C above the seasonal mean temperature			

Table note:

[1]Where this cannot be achieved for turbidity, the water to be discharged is to be at least 10% less than the receiving environment

7.3.4 Landside Stormwater Quality Management Strategy

BAC has prepared the *Landside Stormwater Quality Management Strategy* (Landside SQMS) (BAC 2014c), which provides guidelines for achieving BAC's desired water quality outcomes across Brisbane Airport. The Landside SQMS refers to the CEMP Guidelines to provide guidance on water quality objectives for the construction phase of the Project.

The Landside SQMS (BAC 2014c) identifies in stream water quality indicators from the AEPR, to ensure the protection of ecological functions. Accepted limits from Schedule 2 of the AEPR are detailed in Table 7.2 for receiving waters around Brisbane Airport.

Table 7.2 Water quality indicators for the Project

Key indicator	Water quality target for rivers	Water quality target for lakes	Water quality target for estuaries	Water quality target for coastal waters
pH	6.5-9.0	6.5-9.0	<0.2 pH unit rise	<0.2 pH unit rise
TSS	<10% increase from the seasonal mean TSS	<10% increase from the seasonal mean TSS	<10% increase from the seasonal mean TSS	<10% increase from the seasonal mean TSS
Total nitrogen (TN)	0.1 mg/L	0.1 mg/L	No guidance provided on TN[1]	No guidance provided on TN[1]
Total phosphate (TP)	0.01 mg/L	0.005 mg/L	No guidance provided on TP[2]	No guidance provided on TP[3]

Table notes:

[1]Nitrates, expressed as N: 0.01 mg/L, Ammonia, expressed as N: 0.005 mg/L
[2]Phosphates, expressed as P: 0.005 mg/L
[3]Phosphates, expressed as P: 0.001 mg/L

Appendix C of the Landside SQMS also identifies the EVs and WQOs of Brisbane Airport's receiving waterways. WQOs are numerical concentration levels or narrative statements of indicators established for receiving water to support and protect the designated EVs of those waters. They are based on scientific criteria or water quality guidelines but may be modified by other (social, cultural, economic) inputs. EVs and WQOs for the relevant receiving waters are identified in the Landside SQMS (BAC 2014c) and are outlined in Table 7.3.

Table 7.3 Receiving waterways – environmental values and water quality objectives

WQOs	Kedron Brook[1,2]	Moreton Bay[1,2]
pH	6.5-8.5	6.5-8.5
DO (%)	80-100 saturation	90-105 saturation
TP (mg/L)	<0.06	<0.03
TN (mg/L)	<0.45	<0.2
Turbidity (NTU)	20	5
Total suspended solids (mg/L)	30	<15
Median faecal coliforms	<14 organisms per 100 ml most probable number (MPN), with no more than 10% of samples exceeding 43 organisms per 100 ml MPN	<14 organisms per 100 ml MPN, with no more than 10% of samples exceeding 43 organisms per 100 ml MPN
Helminths	<10 mg per 100 mL	<10 mg per 100 mL

WQOs	Kedron Brook[1,2]	Moreton Bay[1,2]
EVs	■ Aquatic ecosystems ■ Secondary recreation ■ Visual recreation ■ Cultural and spiritual values	■ Aquatic ecosystems ■ Human consumer ■ Primary recreation ■ Secondary recreation ■ Visual recreation ■ Cultural and spiritual values ■ Seagrasses

Table notes:
[1] Brisbane River Environmental Values and Water Quality Objectives 2007
[2] Brisbane Creeks – Bramble Bay Environmental Values and Water Quality Objectives 2007

It should be noted that the EVs and WQOs relate to the water quality within the receiving waters of the Project site and are not directly applicable to stormwater discharges from the Project. The CEMP Guidelines (BAC 2014d) provide site stormwater WQOs during construction, which are outlined in Table 7.1. Typically, concentration based criteria such as that described in the AEPR are unachievable using the current best practice stormwater treatment devices. Whilst these should continue to be viewed as acceptable limits of pollution, pollutant loads reductions objectives provide tangible, transparent and measureable targets that are achievable and ensure a consistent approach to stormwater quality management.

The pollutant load reduction requirements adopted by BAC are summarised within the Landside SQMS (BAC 2014c). These targets have been adopted for the initial identification of potential mitigation options of stormwater quality impacts from the Project and are included in Table 7.4.

Table 7.4 Landside SQMS pollutant load reduction requirements (BAC 2014c)

Stormwater pollutant	Pollutant reduction targets
TSS	80%
TN	60%
TP	45%
Gross Pollutants	90%
Hydrocarbons	No visible sheen or odour

7.4 Existing environment

7.4.1 Surface water

The historical drainage channels of Brisbane Airport generally consist of meandering tidal inlets. The surface hydrology in the area has been highly modified to redirect surface water flow through drains and canals forming a network of low-lying waterways. Based on historical aerial photography, the surface hydrology of the Project site has been modified from its original configuration, as described in Section 5.4.2. During a phase of development in the 1980s, the Project site has been re-contoured and filled with drainage lines reconfigured.

Two surface water courses are identified as present within the Project site, located in the northeast and southwest (refer Figure 1.1). The northern channel drains north through a culvert towards Nancy Bird Way and discharges to Landers Pocket Drain. The southern channel flows north west through a culvert under Moreton Drive and also discharges to Landers Pocket Drain. Both unnamed watercourses are likely to be ephemeral.

To the north-west, the Project site is bound by Moreton Drive and Landers Pocket Drain (approximately 100 m from the site boundary). Landers Pocket Drain is a canalised watercourse and discharges to the Kedron Brook Floodway Drain.

The Kedron Brook Floodway Drain intercepts regional overland flow that moves through the floodplain area of Brisbane Airport and discharges to Bramble Bay, north east of Brisbane Airport. Bramble Bay is classified as high ecological value (marine) under the *Bramble Bay environmental values and water quality objectives No. 142 (part)* (DERM 2010).

Flood mapping indicates that localised flooding is likely to occur in the immediate vicinity of both watercourses on the Project site, with some additional flooding on the north west and south east boundaries (refer Figures 7.3 and 7.4). Based on aerial photography, low lying areas inundated with surface water are also present on the Project site. These are noted by zones of vegetation die back and iron staining on the surface, likely to be associated with potential ASS.

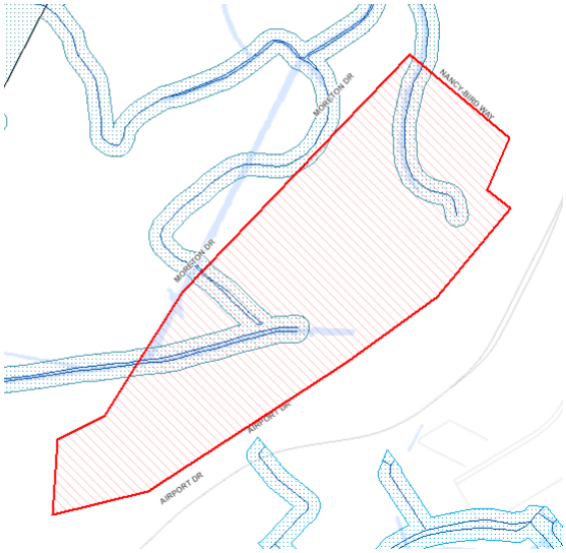

Figure 7.3 BCC PD online – Waterway corridors

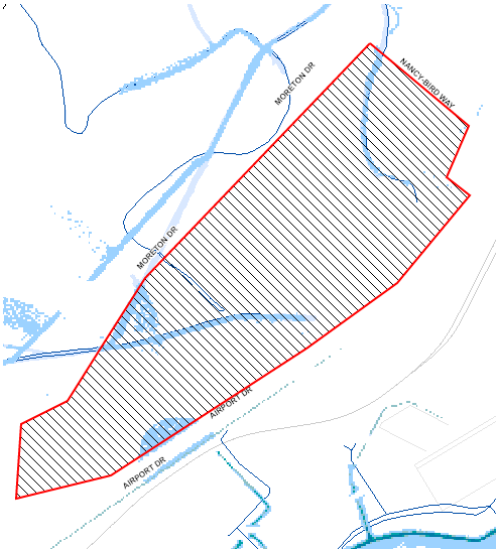

Figure 7.4 BCC PD online – Brisbane River flood planning area

7.4.2 Groundwater

7.4.2.1 Groundwater aquifers

While there are no discrete aquifers present at Brisbane Airport, the geology can be divided into two distinct layers; Upper Holocene alluvia and Lower Holocene alluvia. The shallow aquifer is present in the Upper Holocene, which comprises interlayered clays, silts and sands with low permeability (BAC 2006). The shallow aquifer fluctuates significantly with tidal and rainfall events and discharges to creeks and drains within Brisbane Airport. The Lower Holocene alluvia comprises homogenous clays and silts and contains a deeper groundwater aquifer (BAC 2006). Permeability of the deeper aquifer is very low and groundwater movement is negligible.

It is considered that the Project will not impact on the deeper aquifer given the very low permeability, limited connectivity between the upper and lower aquifers and the ability of the shallow aquifer to discharge into surface water.As such, a shallow groundwater assessment of the Project site was undertaken in two stages by Golders in December 2015 and October 2016. The investigations included the installation of monitoring wells, as well as the monitoring of existing groundwater monitoring wells. The groundwater investigation was detailed in the following reports:

- Golders (2016a) Auto Mall Precinct Stage 1 Contamination report
- Golders (2016b) Auto Mall Precinct Stage 2 Contamination report

Groundwater monitoring locations are indicated in Figure 7.1. Ten boreholes were gauged across two events (4 January 2016 and on 25 October 2016).

7.4.2.2 Groundwater depth

Measured groundwater depths ranged between 0.71 to 2.57 m bgl (0.87 to 2.13 m AD). Boreholes are generally installed within sandy clays and clayey sands.

However, it is noted that groundwater depths are affected by climatic conditions and soil permeability, and potentially tidal influences, and will therefore vary with time. Groundwater monitoring for the proposed parallel runway at Brisbane Airport, in the same floodplain, indicated that during the wet season, the groundwater table height can be expected to be up to 1.0 m higher, and can vary locally with both rainfall and tidal influence (BAC 2006).

7.4.2.3 Groundwater direction

The flow direction was assessed to be towards the west to north west towards Landers Pocket Drain. However, the likely presence of paleo channels within the shallow soils may also exert an influence on groundwater flow direction. The groundwater was found to preferentially follow the course of the historic surface water channels. It was also noted that the geology and soils will have variable hydraulic permeability based on differences between natural ground and fill material used to infill channels and raise ground levels.

7.4.2.4 Groundwater quality

Field physical parameters were measured during the groundwater monitoring events and are summarised in Table 7.5 below.

Table 7.5 Groundwater physical parameters

Parameter	Result	Comment
pH	3.65 – 6.99	Neutral to slightly acidic conditions
Conductivity	1.953 – 51.4 mS/cm	Brackish to saline conditions
Redox	-40.2 to 100.0 mV	Generally anoxic with localised area of anoxic conditions
DO	0.8 – 1.83 mg/L	Low levels of dissolved oxygen in groundwater
Temperature	20.9 – 22.7°C	-

During the ASS investigation, groundwater monitoring results indicated:

- Electrical conductivity ranged from 1,953 to 51,400 µS/cm indicating brackish to saline water conditions
- pH levels ranged from 3.65 to 6.99 indicating acidic to neutral conditions (with the lowest pH levels occurring along the western boundary)
- The buffering capacity of the groundwater varied across the Project site as follows:
  - Groundwater within the northern section of the Project site contained very high alkalinity with a buffering capacity that is adequate to maintain an acceptable pH level
  - Groundwater within the central and southern section of the Project site contained moderate alkalinity with a buffering capacity that is inadequate to maintain a stable, acceptable pH level in areas vulnerable to acidification
  - Groundwater within the southernmost portion of the Project site contained a total acidity that exceeded total alkalinity in the majority of samples indicating a very low buffering capacity that is inadequate to maintain a stable, acceptable pH level in areas vulnerable to acidification
- Dissolved aluminium concentrations of greater than about 1 mg/L in groundwater may be an indicator of AASS. Concentrations were below the laboratory detection limit, with the exception of:
  - AM-BH01 (3.59 mg/L)
  - AM-BH19 (0.06 mg/L)
  - AM-BH14 (0.08 mg/L)
- Dissolved iron concentrations ranged from <0.05 to 294 mg/L
- The chloride:sulfate ratio indicates that past oxidation of PASS has occurred within the Project site

7.5 Potential impacts

7.5.1 Surface water quality

A range of surface water quality impacts have potential to occur during Project works, such as:

- Sedimentation of drainage lines and watercourses from construction activities including clearing of vegetation and earthworks activities due to inadequate erosion and sediment control measures and high rainfall incidence
- Potential disturbance of AASS and PASS, resulting in a decline in water quality
- Hydrocarbon and chemical spills from construction plant and vehicles
- Release of weed seeds and pathogens into drainage lines from vehicles and machinery traversing the Project site
- Discharges from temporary sewerage and site facilities
- Storage and disposal of waste material including spoil placement resulting in the potential leaching of any contaminants
- Litter and rubbish from occupation by construction workers

While there is currently potential for localised flooding to occur within the Project site, Phase 2 works involve raising the Airport Drive median by up to 200 mm in lower areas through landscaping to achieve 1:100 year flood immunity around the Project site. In addition, the existing major culvert crossings will be installed with permanent tidal gates to prevent backwater from regional flood events and storm surge/tidal events entering the Project site once developed.

During Phase 1 earthworks, the existing major culvert crossings entering the Project site will be bunded to prevent tidal water ingress.

Storage basins/channels with a capacity of 44,200 m^3 will be installed for flood storage during storm events.

7.5.2 Groundwater

Potential groundwater impacts during the Project works include:

- The potential for groundwater contamination from fuel and chemical storage and use
- Contamination of exposed groundwater through spills, leaks and surface runoff entering the excavations
- Infiltration of impacted leachate from stockpiled soil originating from the excavations
- The intersection or interaction with the groundwater table of cut and fill earthworks and embankments
- Interference to existing groundwater monitoring bores during construction such that damage to well head infrastructure compromises the seals protecting the groundwater aquifer
- Acid drainage from ASS disturbance potentially impacting groundwater quality
- The production of acid leachate through groundwater fluctuations/disturbances
- Movement of groundwater containing PFAS from the Project site due to surcharge activities

The construction of cuttings and structures can often require dewatering and the intersection of the water table through excavation may lead to passive dewatering of the surrounding groundwater table. In addition, removal of vegetation may result in the rising of the local groundwater table, increasing the likelihood of encountering groundwater during excavation works.

7.6 Mitigation measures

Table 7.6 provides a summary of the management measures for surface water and groundwater to address the potential impacts identified above.

Table 7.6 Water quality potential impacts and mitigation measures

Potential environmental aspect/impact	Management objective	Action	Phase to be implemented	Outcome
Surface water				
Inadequate fuel and chemical storage and usage areas allowing runoff to watercourses	Provide adequate facilities for the refuelling of plant and machinery and storage of chemicals and fuels in locations at least 50 m, or where practicable, away from watercourses	■ Planning of specific refuelling sites, maintenance bays, concrete or bitumen waste containment areas, noting that the Project site will be isolated from external waterways during earthworks construction	Detailed design and construction	To be included in the EMP
		■ Storage of all chemicals and refuelling of vehicles should be within a suitably sized bund (110% capacity). This should occur away from watercourses and drainage lines, noting that the Project site will be isolated from external waterways during earthworks construction ■ Ensure appropriately sized and located spill kits are available on site ■ Ensure spills are cleaned up and disposed of, or remedied immediately, with the necessary equipment and methods	Construction	To be included in the EMP
	Develop and implement emergency control plans to account for fuel, chemical and hydrocarbon spills	■ Implement emergency control plans in the event of any fuel, chemical or hydrocarbon spills. These plans should be developed prior to construction with actions in place to deal with potentially hazardous releases especially when releases could reach receiving waters.	Detailed design/ construction	To be addressed during detailed design, and requirements to be included in the EMP
	Ensure plant and equipment is maintained adequately	■ Undertake regular inspections of equipment ■ Undertake preventative maintenance of equipment	Construction	To be included in the EMP
Soil erosion and sediment entering watercourses after vegetation removal and/or earthworks	Ensure that site inductions cover off on erosion and sediment control and water quality management procedures	■ During the site induction for all personnel working on site, the Contractor's Environmental Officer should be introduced and Project-related environmental concerns identified and discussed. All site personnel should be taught to recognise erosion and sediment and water quality concerns and understand what needs to be done and who needs to be contacted in the event of an erosion and sediment control failure ■ All site personnel have a responsibility to contact the BAC Environmental Advisor if any erosion and sediment control failures are identified or when maintenance is required	Pre-construction and as required during construction	To be included in the EMP

Potential environmental aspect/impact	Management objective	Action	Phase to be implemented	Outcome
	Consider the timing of construction and limiting construction to only the areas necessary to be disturbed	■ Development of a construction ESCP which adopts the measures outlined within this table and in Section 5 ■ All materials received for crushing at the Project site must be stockpiled and crushed within the Project site where stormwater is captured and directed to the perimeter drain prior to discharging to the adjacent waterways	Detailed design and construction	Review and comply with the requirements of the measures outlined within this table
Stormwater runoff does not meet WQOs with the potential to impact downstream environments	Implement drainage controls to manage site stormwater runoff	■ A combination of clean water diversion drains/ banks and dirty water (ie sediment-laden) catch drains/banks to be employed on site to manage stormwater runoff. Construction methods and maintenance of clean water diversions and dirty water flow diversion banks and catch drains to be completed as per the IECA (2008) requirements ■ Upon commencement of works, drains will be bunded externally to prevent tidal water ingress for the duration of earthworks construction ■ During Phase 1 works, temporary earthen bunds and temporary pipes with shut off valves will be used to prevent tidal water ingress to the Project site. During Phase 2 works, flap/tidal gates will be installed at the major culverts under Moreton Drive and Nancy Bird Way to prevent backwater from tidal events, storm surges and regional flood events entering the Project site. ■ A perimeter drain will be installed temporarily during construction around the boundary of the Project site and will be developed to its full profile during and after Phase 1 works are completed ■ Storage basins/channels will be progressively installed for flood storage during Stages 2 and 3 of the Phase 1 works. ■ Catch drains to be installed to capture any sediment-laden runoff from disturbed land due to construction works and direct stormwater towards end-of-line sediment control devices ■ Sediment treatment systems and velocity control structures should be installed within the drainage systems ■ Runoff flow velocity should be controlled through the use of a velocity control structure (eg rock check dams) ■ Regularly monitor and maintain drainage control measures ■ Where captured water has a pH less than 6.0, the water is to be treated prior to release and additional lime added to the base and walls of the excavation, as per the ASS Management Plan (refer Appendix F)	Detailed design/ construction	To be included in the EMP

Potential environmental aspect/impact	Management objective	Action	Phase to be implemented	Outcome
Groundwater				
The potential for groundwater contamination from fuel and chemical storage and use, and contamination of exposed groundwater through spills, leaks and surface runoff entering the excavations	Store chemicals according to environmental best practices Avoid leaks and spills of fuels and chemicals and runoff from exposed soil stockpiles	■ Storage of all chemicals and refuelling of vehicles should be within a suitably sized bund (110% capacity), noting that the Project site will be isolated from external waterways during earthworks construction. This should occur away from waterways and drainage lines ■ Ensure appropriately sized and located spill kits are available on site ■ Implement emergency control plans. These should be developed prior to construction with actions in place to deal with potentially hazardous releases especially when releases could reach receiving waters ■ Ensure spills are cleaned up and disposed of, or remedied immediately, with the necessary equipment and methods ■ Soil stockpiles bunds are recommended in addition to those for fuel and chemical storage	Construction	Requirements to be included in the EMP
Reduction of recharge areas by the construction of hard surfaces	Avoid infiltration and groundwater recharge impedance where possible	■ Direct surface water run-off to specifically designed permeable surfaces. Follow the principles of WSUD to promote infiltration of rainfall	Detailed design	To be addressed during detailed design
Infiltration of leachate into local watercourses from stockpiled soil originating from excavations	Avoid leachate generation from exposed soil stockpiles	■ Staging of works to minimise areas of exposed and disturbed soils. Stage vegetation removal and excavation to minimise exposed areas, where possible ■ Collect stormwater runoff from the Project site for treatment and reuse for activities such as damping down exposed surfaces or landscape irrigation where possible ■ Ensure key construction staff are properly trained in sediment and erosion control and groundwater quality protection	Detailed design/ construction	To be addressed during detailed design, and requirements to be included in the EMP

Potential environmental aspect/impact	Management objective	Action	Phase to be implemented	Outcome
The intersection or interaction with the groundwater table and potential impacts to water quality through construction activities, including construction of embankments, or migration of potential contaminants in groundwater	Establish the underlying hydrogeological conditions at points of intersection, particularly in areas of unconsolidated material	■ Construction groundwater monitoring (to assess potential ASS impacts) will need to be undertaken in accordance with the ASS Management Plan (refer Appendix F) and compared to the established baseline monitoring reported by Golders (2016c; d) (refer Appendix D). ■ Groundwater monitoring will be undertaken during filling and until excess surcharge material is removed within the monitoring wells indicated in Figure 7.1 ■ Only wells located adjacent to, or within 50 m laterally of, filling and surcharging activities need to be monitored ■ New groundwater monitoring wells (as shown on Figure 7.1) will be installed progressively around the outer edge of the proposed perimeter drain or flood storage by an appropriately licensed driller in accordance with the requirements of the *Minimum Construction Requirements for Water Bores in Australia* (National Uniform Drillers Licensing Committee 2012) ■ Internal groundwater monitoring wells will be progressively decommissioned as each encroaching earthworks stage progresses ■ Groundwater shall be monitored for PFAS and dissolved metals/metalloids (aluminium, arsenic, cadmium, chromium, copper, iron, lead, mercury, nickel, zinc and titanium (if required)): – Monthly during placement of fill and surcharge activities for a period of six months or until results of monitoring stabilise over a three month period (and provided that performance limits have been met, and continue to be met) – Once every six months for the remainder of fill placement and surcharge activities (provided that performance limits continue to be met) – Once every six months for removal of surcharge and completion of earthworks (provided performance limits remain to be met) ■ Upon completion of surcharging and earthworks, groundwater monitoring will cease with no further actions required ■ Should potential contamination be identified during groundwater monitoring, an investigation must be undertaken to determine the potential source and extent of the contamination of the groundwater in consultation with the BAC Environment Advisor	Construction	Requirements to be included in the EMP

Potential environmental aspect/impact	Management objective	Action	Phase to be implemented	Outcome
		■ Groundwater shall be monitored for ASS: – For one round of baseline data upon installation of any new groundwater wells prior to construction commencing – Monthly during placement of fill and surcharge earthworks for field measurements and every two months for laboratory analysis – Monthly during surcharging activities for field measurements for the initial two months and monthly until groundwater level has stabilised, and every two months for laboratory analysis for at least six months and until results of monitoring stabilise over a four month period ■ For assessment of potential ASS impacts, samples should be analysed for: – Field measurements: water level, pH, electrical conductivity, redox potential, total alkalinity – Laboratory analysis: pH, electrical conductivity, total titratable acidity, total alkalinity, dissolved iron and aluminium, dissolved ions (chloride and sulphate)		

8 Air quality, odour and dust management

8.1 Introduction

This section investigates the potential impacts of the Project on local air quality and discusses appropriate mitigation measures for management of these potential impacts.

8.2 Methodology

A review of the legislative requirements in relation to air quality and dust management was undertaken. This review identified the relevant air quality goals for the Project site.

Existing air quality data relevant to the Project site was sourced from the EHP air quality monitoring site at Wynnum, approximately 6 km south east of the Project site. Climate data relevant to the Project site was sourced from the Bureau of Meteorology's (BoM) Brisbane Airport site to identify climatic conditions currently experienced within and surrounding the Project site.

This data has been used to assist with the assessment of the potential impacts to air quality as a result of the Project during construction and operation.

8.3 Legislative requirements

A review of the legislative requirements for air quality and dust management was undertaken. This identified the relevant air quality goals for the Project site.

The following legislation related to air quality is potentially relevant to the Project:

- AEPR – Schedule 1, Part 2 of the AEPR outlines the ambient air quality objectives for airport land. The indicators relevant to airport land include lead, photochemical oxidants, sulphur dioxide, total suspended particulates, nitrogen dioxide, sulfates and carbon monoxide.
- Air NEPM – Schedule 2 of the Air NEPM outlines national ambient air quality standards for carbon monoxide, ozone, sulphur dioxide, nitrogen dioxide, lead and particles. The standards were designed to give an 'average' representation of general air quality. That is, the NEPM monitoring protocol was not designed to apply to the monitoring or modelling of peak concentrations from major emissions sources (NEPC 2003).
- Air Toxics NEPM – Schedule 3 of the Air Toxics NEPM outlines monitoring investigation levels for five air toxins including benzene, formaldehyde, benzo(a)pyrene as a marker for polycyclic aromatic hydrocarbons, toluene and xylenes
- EPP (Air) – Schedule 1 of the EPP (Air) specifies air quality indicators and goals for Queensland to protect environmental values. The EPP (Air) provides a more comprehensive list of air quality goals compared with the AEPR and Air NEPM.

8.4 Air quality standards

The applicable air quality goals are provided in Table 8.1 below. For the purposes of this Project, the most stringent air quality standards and goals for each pollutant have been highlighted in bold font.

Table 8.1 Air quality goals relevant to this Project

Pollutant	Goal	Averaging period	Legislative instrument
Carbon monoxide (CO)	**10 mg/m^3 or 9 ppm**	8 hours	AEPR
	9 ppm	8 hours[1]	Air NEPM
	11 mg/m^3 or 9 ppm	8 hours[1]	EPP (Air)
Nitrogen dioxide (NO_2)	320 µg/m^3 or 0.16 ppm	1 hour	AEPR
	0.12 ppm	1 hour[1]	Air NEPM
	0.03 ppm	1 year	
	250 µg/m^3 or 0.12 ppm	1 hour[1]	EPP (Air)
	62 µg/m^3 or 0.03 ppm	1 year	
Photochemical oxidants (as ozone)	**210 µg/m^3 or 0.10 ppm**	1 hour	AEPR
	170 µg/m^3 or 0.08 ppm	4 hours	
	0.10 ppm	1 hour[1]	Air NEPM
	0.08 ppm	4 hours[1]	
	210 µg/m^3 or 0.10 ppm	1 hour[1]	EPP (Air)
	160 µg/m^3 or 0.08 ppm	4 hours[1]	
Particulate matter less than 10 µm (PM_{10})	N/A	N/A	AEPR
	50 µg/m^3	1 day[2]	Air NEPM
	50 µg/m^3	24 hours[2]	EPP (Air)
Particulate matter less than 2.5 µm ($PM_{2.5}$) (advisory* only)	N/A	N/A	AEPR
	25 µg/m^3	1 day	Air NEPM
	8 µg/m^3	1 year	
	25 µg/m^3	24 hours	EPP (Air)
	8 µg/m^3	1 year	
Total suspended particulates	**90 µg/m^3**	1 year	AEPR
	N/A	N/A	Air NEPM
	90 µg/m^3	1 year	EPP (Air)
Sulfur dioxide (SO_2)	**700 µg/m^3 or 0.25 ppm**	10 minutes	AEPR
	570 µg/m^3 or 0.20 ppm	1 hour	
	60 µg/m^3 or 0.02 ppm	1 year	
	0.20 ppm	1 hour[1]	Air NEPM
	0.08 ppm	1 day[1]	
	0.02 ppm	1 year	
	570 µg/m^3 or 0.20 ppm	1 hour[1]	EPP (Air)
	230 µg/m^3 or 0.08 ppm	1 day[1]	
	57 µg/m^3 or 0.02 ppm	1 year	
Lead	1.5 ppm	3 months	AEPR
	0.50 µg/m^3	1 year	Air NEPM
	0.50 µg/m^3	1 year	EPP (Air)

Pollutant	Goal	Averaging period	Legislative instrument
Benzene	N/A	N/A	AEPR
	0.003 ppm^	1 year#	Air Toxics NEPM
	10 µg/m^3 or 0.003 ppm	1 year	EPP (Air)
Benzo(a)pyrene as a marker for Polycyclic Aromatic Hydrocarbons	N/A	N/A	AEPR
	0.3 ng/m^3^	1 year#	Air Toxics NEPM
	0.3 ng/m^3	1 year	EPP (Air)
Formaldehyde	N/A	N/A	AEPR
	0.04 ppm^	24 hours	Air Toxics NEPM
	54 µg/m^3 or 0.04 ppm	24 hours	EPP (Air)
Toluene	N/A	N/A	AEPR
	1 ppm	24 hours	Air Toxics NEPM
	0.1 ppm	1 year#	
	4.1 mg/m^3 or 1 ppm	24 hours	EPP (Air)
	410 µg/m^3 or 0.1 ppm	1 year	
Xylene (as total of ortho, meta and para isomers)	N/A	N/A	AEPR
	0.25 ppm	24 hours	Air Toxics NEPM
	0.2 ppm	1 year#	
	1.2 mg/m^3 or 0.25 ppm	24 hours	EPP (Air)
	950 µg/m^3 or 0.2 ppm	1 year	

Table notes:
[1] One day per year maximum allowable exceedance
[2] Five days per year maximum allowable exceedances
For the purposes of this Air Toxics NEPM, the annual average concentrations in the "Goal" column are the arithmetic mean concentrations for 24-hour monitoring results.
^ 8-year goal is to gather sufficient data nationally to facilitate development of a standard.
* An Advisory Reporting Standard means a health-based standard to assess the results of monitoring for particles as $PM_{2.5}$. These standards do not have a timeframe for compliance associated with them.

There are no national air quality guideline values for nuisance dust deposition to assess the impact of dust on the receiving environment. However, as per the *Guideline: Application requirements for activities within impacts to air* (EHP 2017e), a dust deposition limit of 120 mg/m^2/day is typically used in Queensland, when monitored in accordance with AS3580.10.1:2003. This can be normalised to a 30 day month to give a monthly dust deposition limit of 3.6 g/m^2/month.

8.5 Existing environment

8.5.1 Review of existing data

The Project site is located in close proximity to major road corridors such as the Gateway Motorway, Airportlink M7 tunnel, and Moreton Drive as well as some of Brisbane's major industrial precincts which include oil refineries, chemical manufacturers and the Port of Brisbane (BAC 2014b). Based on reporting from the National Pollutant Inventory, Table 8.2 details sources of air quality emissions that are located within 3 km of the Project site.

Given that these industrial facilities and road corridors discharge various pollutants into Brisbane's airshed and are in close proximity to the Project site, the air quality at Brisbane Airport would be influenced by these adjacent industries and activities as well as by emission sources associated with the operation of Brisbane Airport.

Table 8.2 Emission sources within 3 km of Project site (based on 2014/2015 emissions)

Facility name	Suburb
Bradken CMS Northgate	Northgate
Qantas Airways, Brisbane Airport	Brisbane
Brisbane Airport Corporation	Brisbane Airport
BOC Limited, Bulwer Island	Pinkenba
GE Water & Process Technologies	Northgate
James Hardie Concrete Pipes	Meeandah
Pinkenba Malthouse	Pinkenba
Shell Service Station, Brisbane Airport	Eagle Farm
Pinkenba Terminal, Viva Energy	Pinkenba

Source: Department of the Environment 2015

8.5.2 Receptors potentially sensitive to air quality changes

Figure 8.1 shows the location of receptors that are in close proximity to the Project site and would have the potential to be sensitive to changes in air quality.

The closest commercial receptors are:

- Kingsford Smith Memorial and Southern Cross Aircraft (95 m north east)
- Tenancies along Nancy Bird Way, such as:
  - Brisbane Airport Services Centre (directly across Nancy Bird Way), including:
    - Shell Coles Express
    - McDonalds and other food outlets
    - Vehicle servicing precinct – Ultra Tune, Sparkles Car Wash
  - Thrifty Car Rental and Hire
  - CPA Remote Public Car Park (directly across Moreton Drive)
- Tenancies along Bert Hinkler Drive, such as:
  - CPA Staff Car Park Stages 1 and 2
  - CPA Staff Car Park Stages 3 and 4 (under construction)
  - Taxi, bus and limousine parking
- Tenancies along Ivy May Way such as:
  - Europcar Car Rental
  - Avis Car Rental
  - Budget Car Rental
  - Hertz Car Rental
  - Qantas Valet Storage Facility
- Tenancies within the International Terminal (across Airport Drive), such as:
  - Airtrain services
  - Secure car parking
  - International Terminal lounge, food and shopping outlets
- Commercial tenancies along Qantas Drive (across Airport Drive)

The nearest residential suburbs are Eagle Farm (1.25 km south west of the Project site) and Hendra, Nundah, Northgate and Banyo, which are located more than 2 km west and north of the Project site. The nearest sensitive receptors to the Project site include:

- Northgate State School (2.6 km west)
- Hendra State School (2.75 km south west)
- Novotel Hotel (1.8 km south west)
- Tadpoles and Joey Club Childcare Centre (2.1 km south west)
- Pullman and Ibis Hotel (1.5 km north) (under construction)

8.5.3 Air quality data

As indicated in Section 8.5.2 above, the Project is located in the vicinity of areas currently used or under development for general industry and commercial uses. The local airshed is influenced predominantly by the road network connecting these activities and by the operation of the airport itself.

Caltex Refineries (Qld) Ltd operate three air quality monitoring sites in Wynnum to assess the impact of refinery emissions on nearby sensitive receptors. The oldest of the air quality sites commenced operation in 2004 and the two additional sites were added to the network in March 2014. This air quality monitoring network is located approximately 5 km south east of the Project site.

Air quality indicators monitored at the Wynnum sites include nitrogen oxides, sulphur dioxide, PM_{10} and $PM_{2.5}$. A summary of the monitored pollutant concentrations from Wynnum between December 2014 and November 2016 is presented in Table 8.3, together with the AEPR, Air NEPM and EPP (Air) guidelines and indicators.

Table 8.3 Air quality data from Wynnum air quality network December 2014 to November 2016

Parameter	AEPR	Air NEPM	EPP (Air)	Averaging period	Maximum pollutant concentration at Wynnum network	Exceedances at Wynnum network
Nitrogen dioxide	0.12 ppm	0.12 ppm	250 µg/m^3 0.12 ppm	1 hour	0.041 ppm (July 2016)	0
	0.03 ppm	0.03 ppm	62 µg/m^3 0.03 ppm	1 year	-	N/A
Sulfur dioxide	0.20 ppm	0.20 ppm	570 µg/m^3 0.2 ppm	1 hour	0.134 ppm (April 2015)	0
	0.08 ppm	0.08 ppm	230 µg/m^3 0.08 ppm	1 day	0.049 ppm (December 2014)	0
	0.02 ppm	0.020 ppm	57 µg/m^3* 0.02 ppm	1 year	-	N/A
PM_{10}	50 µg/m^3	50 µg/m^3	50 µg/m^3	1 day	44.6 µg/m^3 (April 2015)	0
$PM_{2.5}$	-	25 µg/m^3	25 µg/m^3	1 day	19.6 µg/m^3 (September 2016)	0
	-	8 µg/m^3	8 µg/m^3	1 year	-	N/A

Table notes:
* Health and biodiversity of ecosystems
Source: Department of Science, Information Technology and Innovation 2017

According to the results in Table 8.3, the existing air quality adjacent to the Brisbane Airport at Wynnum is considered acceptable and within nominated standards. However, it should be noted that the recorded maximum pollutant concentration for PM_{10} (44.6 µg/m^3) was close to the PM_{10} standard of 50 µg/m^3.

8.5.4 Climatic conditions

BoM operates a meteorological site at Brisbane Airport (040842). This meteorological site is located approximately 2.3 km north east of the Project site. Table 8.4 summarises the long term average climate data recorded for the meteorological site.

Table 8.4 Meteorological data for Brisbane Airport (040842)

Parameter	January	February	March	April	May	June	July	August	September	October	November	December	Annual average
Max temp (°C)	29.0	29.0	28.0	26.0	23.6	21.2	20.9	21.9	24.2	25.5	26.9	28.1	25.4
Min temp (°C)	21.3	21.1	19.6	16.4	12.9	10.7	9.1	9.8	12.8	15.6	18.3	20.1	15.6
Rainfall (mm)	136.4	118.4	98.5	79.2	104.2	69.7	28.9	40.1	34.7	69.5	97.7	126.3	1049
9am wind speed (km/hr)	15.5	14.3	14.3	14.5	15.7	15.6	16.3	15.3	15.0	15.5	16.2	16.2	15.4
3pm wind speed (km/hr)	23.3	21.2	20.8	18.8	16.7	16.5	17.8	20.4	24.0	25.3	24.8	24.7	21.2

Source: Bureau of Meteorology 2017

The data in Table 8.4 indicates that rainfall within the Project site and surrounding areas occurs predominantly during summer (December to February), with the highest average occurring during January. The lowest rainfall months are June to September, with July having the lowest monthly average of 28.9 mm. The highest average monthly maximum temperature was 29.0°C (recorded in January and February) while the lowest average monthly maximum temperature was 20.9°C (recorded in July). The highest average monthly minimum temperature was 21.3°C (recorded in January), while the lowest average monthly minimum temperature was 9.1°C (recorded in July).

The average wind speeds at 9.00 am are approximately:

- 15.3 km/hr during summer months (December – February)
- 14.8 km/hr during autumn months (March – May)
- 15.7 km/hr during winter months (June – August)
- 15.6 km/hr during spring months (September – November)

The average wind speeds at 3.00 pm are approximately:

- 23.1 km/hr during summer months (December – February)
- 18.8 km/hr during autumn months (March – May)
- 18.2 km/hr during winter months (June – August)
- 24.7 km/hr during spring months (September – November)

Wind rose data was obtained from the BoM at Brisbane Airport (040842) and is presented in Figures 8.2 and 8.3. The predominant wind direction at 9.00 am during summer is northerly and then south-easterly and predominantly south-westerly during winter (refer Figure 8.2). At 3.00 pm, the winds are predominantly northerly/north-easterly, with some south-easterly winds in summer, while winds are predominantly north-easterly to south-easterly during winter (refer Figure 8.3).

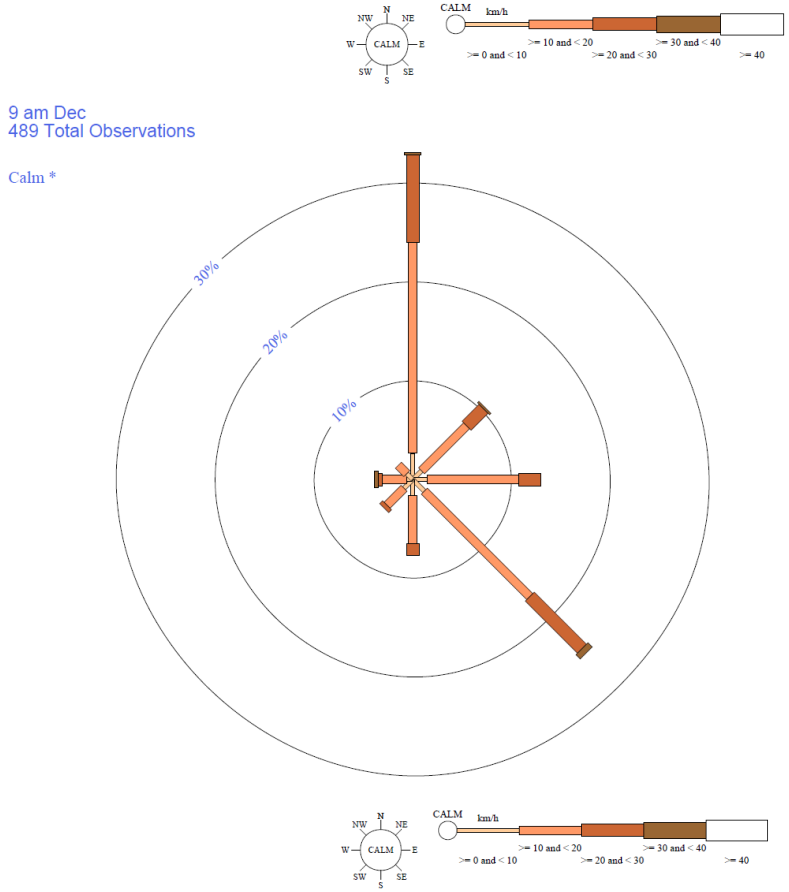

Figure 8.2 **December (summer) and July (winter) wind roses at 9 am for Brisbane Airport (040842) (based on data from 1 April 1994 to 30 September 2010) (BoM 2017)**

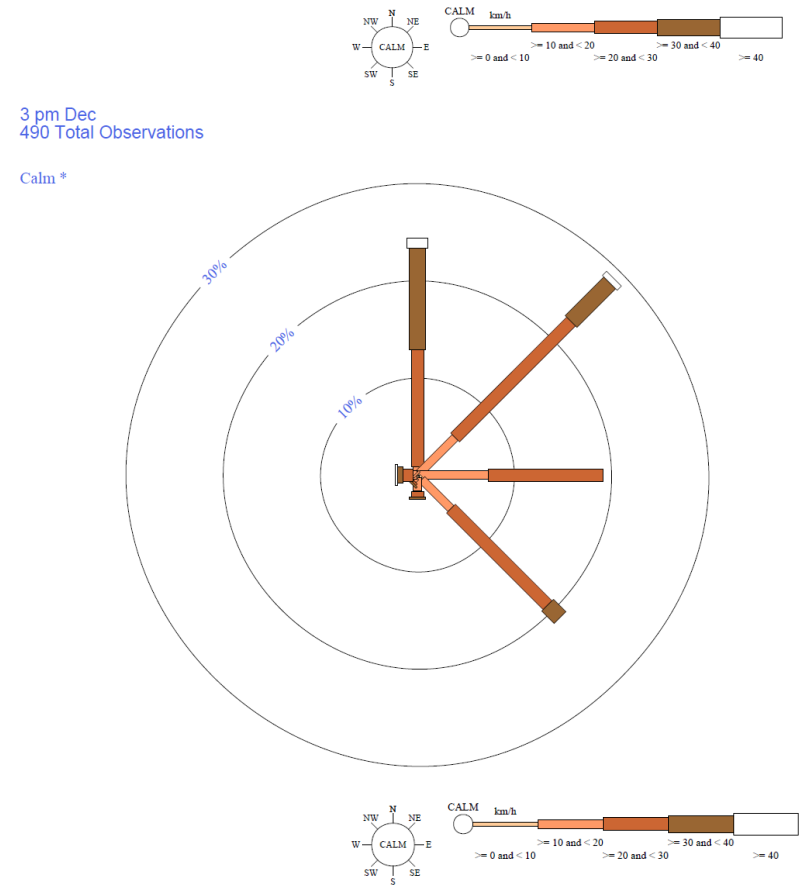

Figure 8.3 **December (summer) and July (winter) wind roses at 3 pm for Brisbane Airport (based on data from 1 April 1994 to 30 September 2010) (BoM 2017)**

8.6 Potential impacts

Construction activities will potentially generate dust impacts. Activities with the potential to generate dust include:

- Transporting of fill material to site
- Processing of fill (crushing and screening)
- Stockpiling of fill
- Loading of fill onto trucks for placement
- Transport of fill around the site for placement
- Placing of fill on site
- Minor excavation works
- Removal of vegetation
- Construction of embankments
- Drain upgrade and realignment earthworks

Dust generation, resulting from construction earthworks (eg vegetation clearing, traffic movement over bare surfaces and rock crushing activities), has the potential to impact on the Kingsford Smith Memorial, neighbouring commercial businesses, car rentals and parking and the International Terminal if mitigation measures are not implemented. It is considered that the car rental, valet tenancies and car wash are likely to be sensitive to air quality changes, given their proximity to the Project site and the nature of their business (ie supplying cars that customers expect to be clean).

Wind speeds are noticeably higher during the afternoon in both spring and summer, with the potential to cause airborne dust from stockpiles and exposed areas during construction and to carry dust generated from rock crushing and screening. Dust suppression measures would need to be applied, particularly in high wind conditions.

Wind direction at Brisbane Airport is generally from the north, north-east and south-east at speeds between 20 and 30 km/h but up to 40 km/h, particularly in the afternoon. However, between April and September, wind direction at 9am at Brisbane Airport is predominately from the south west (20 to 30 km/h). Morning activities during these months may have an increased risk from dust deposition on the Kingsford Smith Memorial, which is located north-east of the Project site.

During settlement, there is the potential for dust to be generated if fill areas are not adequately covered.

Monitoring was undertaken monthly on a similar project at the CPA Staff Carpark, including the Western Drain upgrade and Stage 3 bulk earthworks from October 2015 until October 2016. Dust deposition rates during this period ranged from 0.8 to 6.4 g/m^2/month, with an average of 2.19 g/m^2/month (PSK 2016). There was only one instance of dust deposition above the Queensland dust deposition limit of 3.6 g/m^2/month, which occurred in October/November 2015 (PSK 2016). These results indicate that these types of Projects can be managed to comply with the Queensland dust deposition limit.

Dust deposition monitoring was conducted at the Kingsford Smith Memorial from October 2008 to September 2009 during the Brisbane Airport Northern Access Road Project (eg Nancy Bird Way), which is directly adjacent to the Memorial. Dust deposition results from inside the Kingsford Smith Memorial ranged from 0.8 to 4.6 g/m^2/month while results collected from outside the Kingsford Smith Memorial ranged from 1.7 to 8.9 g/m^2/month. No complaints were received during the Northern Access Road Project regarding the Kingsford Smith Memorial.

There is the potential for construction and operation-related traffic to contribute towards minor local air quality issues (other than dust impacts). The impact on local air quality during construction traffic will not be significant given the temporary nature of construction and the existing emissions from the high volume of vehicles currently using nearby roads such as Moreton Drive, Airport Drive and Nancy Bird Way.

It is considered that residential areas and sensitive receptors are a sufficient distance away from the Project site and will not experience any air quality impacts as a result of the Project.

It is envisaged that minimal impacts associated with climatic patterns will occur during the operation of the Project.

8.7 Mitigation measures

Table 8.5 provides management measures that are recommended to mitigate the potential impacts identified above.

Table 8.5 Potential air quality impacts and mitigation measures

Potential environmental aspect/ impact	Management objective	Action	Phase to be implemented	Outcome
Reduced air quality at nearby commercial premises (dust and particulate generation) from construction related activities	Undertake baseline dust monitoring program for the Project	■ Undertake baseline dust deposition monitoring prior to construction, involving the following: – Install dust deposition gauges at five locations (refer Figure 7.1): ■ Kingsford Smith Memorial ■ International Terminal car park ■ North of Qantas Engineering on Qantas Drive ■ Along the south eastern boundary of the CPA Remote Car Park ■ Brisbane Airport Services Centre – Collect and replace dust deposition gauge sample bottles on a monthly basis for three months starting no less than two weeks before construction. – Dust deposition gauge preparation, sample collection and sample analysis should be conducted in accordance with: ■ AS/NZ 3580.10.1:2003 – Methods for Sampling and Analysis of Ambient Air, Method 10.1 Determination of Particulate Matter – Deposited Matter – Gravimetric Method ■ Monitoring and Sampling Manual 2009 (EHP 2009) ■ Dust deposition samples are to be analysed by a National Association of Testing Authorities (NATA) accredited laboratory. Results are to be recorded.	Prior to construction	To be included in the EMP

Potential environmental aspect/ impact	Management objective	Action	Phase to be implemented	Outcome
	Undertake construction dust monitoring program for the Project	■ Undertake construction dust deposition monitoring, involving the following: – Install dust deposition gauges at five locations (refer Figure 7.1): ■ Kingsford Smith Memorial ■ International Terminal car park ■ North of Qantas Engineering on Qantas Drive ■ Along the south eastern boundary of the CPA Remote Car Park ■ Brisbane Airport Services Centre (for half of Stage 1 works only, if no validated complaints are received) – Collect and replace dust deposition gauge sample bottles on a monthly basis throughout construction – Dust deposition gauge preparation, sample collection and sample analysis should be conducted in accordance with: ■ AS/NZ 3580.10.1:2003 – Methods for Sampling and Analysis of Ambient Air, Method 10.1 Determination of Particulate Matter – Deposited Matter – Gravimetric Method ■ Monitoring and Sampling Manual 2009 (EHP 2009) ■ Dust deposition samples are to be analysed by a NATA accredited laboratory. Results should be assessed against the advisory limit of 3.6 g/m^2/month, and results provided in a monthly report. ■ If the samples reveal an exceedance of the 3.6 g/m^2/month advisory level, the cause of the exceedance should be investigated. Additional mitigation measures should be investigated and implemented to manage future dust impacts generated by the project if needed	Construction	To be included in the EMP

Potential environmental aspect/ impact	Management objective	Action	Phase to be implemented	Outcome
Dust and pollutants generated by vehicles travelling on unpaved areas	Minimise local air quality impacts as a result of construction related traffic	■ To minimise the tracking of sediment off site, the Contractor will specify appropriate measures in the ESCP in consultation with the BAC Environmental Advisor ■ Maintain sealed vehicle access points from existing roads to the Project site where possible ■ Cover loads on haulage trucks ■ Stabilisation and regular watering of haul routes and traffic areas within the Project site using water carts to minimise the generation of dust. To further minimise dust generation, chemical dust suppressants, and increased utilisation of water carts and/or fixed irrigation can be used on selected roads to maintain high moisture levels ■ Restrict construction vehicle speed to a speed suitable to avoid the generation of dust ■ Ensure all construction vehicles, plant and machinery are maintained and operated in accordance with design standards and specifications ■ Ensure construction vehicles are switched off when not in use	Construction	To be included in the EMP
Dust generated from exposed areas disturbed by removal of vegetation	Stage clearing of vegetation to minimise the area of exposed ground at any one time	■ Disturb only the minimum area necessary. Reshape, topsoil and rehabilitate completed areas as soon as practicable after the completion of works	Construction	To be included in the EMP
Dust generated by uncovered fill and surcharge material during settlement	Appropriately cover areas that are in the process of settlement	■ Semi-permanent cover (eg hydromulch etc) should be used on areas that are in the process of settlement if considered necessary in consultation with the BAC Environmental Advisor	Construction	To be included in the EMP

Potential environmental aspect/ impact	Management objective	Action	Phase to be implemented	Outcome
Reduced air quality within surrounding areas (including adjacent tenancies and Kingsford Smith Memorial) due to dust and particulate generated from construction activities	Implement dust suppression/ control measures during construction	■ Use dust suppression techniques on stockpiles (eg water carts) to reduce the risk of airborne dust as required ■ If necessary, use a dust suppressant such as Vital Bon-Matt where practical, in consultation with the BAC Environmental Advisor ■ Use temporary cover (ie black plastic, turf, jute matting etc) where necessary to avoid the potential for wind-blown dust during construction, in consultation with the BAC Environmental Advisor ■ Monitor prevailing meteorological conditions, including wind speed and direction during construction, excavation and fill works and postpone works if dust impacts on sensitive receptors cannot be appropriately managed ■ Undertake daily visual inspections for airborne dust	Construction	To be included in the EMP
	Adoption of management measures to reduce fire-related dust generation	■ No fires on site ■ In accordance with the ESCP, cleared vegetation may be reused as mulch on site for erosion and sediment control. Cleared vegetation is not to be burned	Construction	To be included in the EMP
Complaints from adjacent tenants regarding air quality	Implement a complaints register system	In the event of an air quality complaint, undertake the following measures: ■ Investigate the cause of the complaint through consultation with the complainant. Review and log the type, location and duration of site activity and meteorological conditions at the time of the complaint ■ Where the complaint is validated, analyse the results of the air quality monitoring and use this data to assist with the assessment of the impacts and in the development and implementation of appropriate work procedures or mitigation measures to minimise further impacts ■ Within 14 days of the receipt of a validated air quality complaint, report the results of the investigation and the actions taken to 'close out' the complaint to the complainant and BAC Environmental Advisor	Construction	Requirement to be included in the EMP

9 Noise and vibration

9.1 Introduction

This section outlines the potential issues relating to noise and vibration associated with the Project and discusses appropriate mitigation measures to be undertaken during the construction stages.

9.2 Methodology

A review of the relevant legislative and policy instruments relating to noise and vibration control during construction was undertaken, identifying the applicable standards to be applied to the Project. An assessment of the existing environment was based on a desktop review of nearby sensitive receptors and previous noise and vibration studies for similar projects. Potential noise and vibration impacts were identified and mitigation measures recommended.

9.3 Relevant legislation

Legislation relevant to the Project is summarised in Section 3 of this EAR. The specific provisions relating to noise and vibration management are discussion the section below.

9.3.1 Airports (Environment Protection) Regulations 1997

9.3.1.1 Noise sources

Ground-based noise on the airport site other than noise generated by an aircraft in flight, when landing, taking off or taxiing at an airport, is regulated by the AEPR. The ground-based noise sources surrounding the Project site have been identified in the AES as the following:

- Road traffic and rail
- Construction and development sites
- Operation of plant or machinery
- Operation of alarm or warning systems
- Aircraft engine ground running

9.3.1.2 Sensitive receptors

Part 2, Division 2, Regulation 2.04 of the AEPR defines sensitive receptors as follows:

(a) Dwelling

(b) An impermanent dwelling in a place designed, or reserved, for impermanent dwellings (for example, a caravan park or residential marina)

(c) A hotel, motel or hostel

(d) A child care institution, kindergarten, school, college, university or other educational institution

(e) A hospital, medical centre or nursing home

(f) A building that is a church or similar place of worship

Schedule 4, Part 3 of the AEPR also makes reference to commercial receptors, and states that the indicators of noise for sensitive receptors are the same for commercial receptors except for considerations of the following factors:

- *The nature of the business conducted at the site*
- *The time of day when the noise occurs*
- *The duration of the noise*
- *The nature and characteristics (if any) of the noise*
- *The background noise level*

9.3.1.3 Construction noise criteria

Applicable standards to be applied to the Project have been identified. The applicable noise criteria for road traffic and construction noise are found in the AEPR and are summarised in Table 9.1.

Table 9.1 Applicable noise criteria for construction and road traffic noise

Noise source	Noise criteria	Note
Construction (construction, maintenance or demolition of a building or other structure at an airport)	$L_{A10(15\ minute)}$ 75 dBA	Assessed at the site of a sensitive receptor Adjusted for tonal character or impulsiveness
Road traffic (generated from road traffic on the site of an operator of an undertaking at an airport)	$L_{Aeq(24\ hour)}$ 60 dBA	Assessed at the site of a sensitive receptor
	$L_{Aeq(8\ hour)}$ 55 dBA	Assessed at the site of a sensitive receptor Assessed between 22:00 and 06:00 hours

9.3.2 BAC's Noise Impact Assessment Policy

BAC's *Noise Impact Assessment Policy* (NIAP) (2009) sets out how various noise impacts should be considered when determining the level of noise assessment and any suitable mitigation measures required for new developments.

BAC is committed to applying this policy to ensure each proposed development on-airport is appropriately assessed for potential noise impacts. The NIAP applies to new development sites on airport land, and takes account of potential noise generated during construction and operation phases, as well as the way existing noise sources impact on those proposed new developments.

The NIAP recommends that an historical examination of noise levels and its effect on its neighbours can be used as an appropriate assessment mechanism where a proposed development is:

- Consistent with other existing land uses in the precinct and will not affect sensitive receptors, or
- Not consistent with other existing land uses in the precinct but the likely noise impacts would not be significantly greater than existing precinct noise levels and would not impact on sensitive receptors

In all other cases, a noise assessment study (prepared by qualified noise consultants) is to be undertaken.

The Project is considered to be consistent with other existing land uses in the precinct and will not affect sensitive receptors during operation. The bulk earthworks phase of the Project will generate noise from material processing (eg earth, rock), including sorting, crushing, processing and stockpiling. An assessment of noise related impacts from these activities is provided in Section 9.5.

9.3.3 Vibration

No vibration related goals are discussed in the AEPR. The Australian Standard *AS 2436-2010 Guide to noise and vibration control on construction, demolition and maintenance sites* also does not provide vibration goals. However, it provides guidance on how vibration control should be undertaken on construction sites.

AS 2436-2010 recommends implementing time restrictions on processes involving exposure to potentially hazardous vibration, low-vibration plant and equipment, and signposting of vibration hazardous areas. Monitoring is identified in AS 2436-2010 as an essential component in the effective control of vibration from construction sites.

The *Guideline: Noise and vibration from blasting* (EHP 2016c) provides vibration criteria for construction blasting with a peak velocity for ground vibration set at 5 mm/s. Whilst no blasting will be conducted as part of Project works, the vibration criteria provide a vibration limit that can be implemented at the nearest sensitive structure (Kingsford Smith Memorial). This criteria is well below levels at which structural damage will occur. Vibrations below this criteria are unlikely to cause cosmetic cracking, including minor non-structural effects such as superficial cracking in cement render or plaster.

9.4 Existing environment

9.4.1 Noise

9.4.1.1 Regional context and sensitive receptors

The Project site is a high noise environment and is exposed to high levels of daytime background noise from the following sources:

- Vehicular traffic on Moreton Drive, Airport Drive and Nancy Bird Way
- Low-flying aircraft during the land-take-off cycle
- Intermittent noise from surrounding construction activities (eg CPA)

The closest commercial receptors include:

- Kingsford Smith Memorial and Southern Cross Aircraft (95 m north east)
- Tenancies along Nancy Bird Way, such as:
  - Brisbane Airport Services Centre (approximately 50 m north, directly across Nancy Bird Way), including:
    - Shell Coles Express
    - McDonalds and other food outlets
    - Vehicle servicing precinct – Ultra Tune, Sparkles Car Wash
  - Thrifty Car Rental and Hire
  - CPA Remote Public Car Park (approximately 120 m north west, directly across Moreton Drive)
- Tenancies along Bert Hinkler Drive, such as:
  - CPA Staff Car Park Stages 1 and 2
  - CPA Staff Car Park Stages 3 and 4 (under construction)
  - Taxi, bus and limousine parking
- Tenancies along Ivy May Way such as:
  - Europcar Car Rental
  - Avis Car Rental
  - Budget Car Rental
  - Hertz Car Rental
  - Qantas Valet Storage Facility
- Tenancies within the International Terminal (across Airport Drive), such as:
  - Airtrain services

- Secure car parking
- International Terminal lounge, food and shopping outlets

- Commercial tenancies along Qantas Drive (across Airport Drive)

The nearest residential suburbs are Eagle Farm (1.25 km south west of the Project site) and Hendra, Nundah, Northgate and Banyo, which are located than 2 km west and north of the Project site. The nearest sensitive receptors to the Project site include:

- Northgate State School (2.6 km west)
- Hendra State School (2.75 km south west)
- Novotel Hotel (1.8 km south west)
- Tadpoles and Joey Club Childcare Centre (2.1 km south west)
- Pullman and Ibis Hotel (1.5 km north) (under construction)

Figure 8.1 identifies the location of these potentially sensitive receptors.

9.4.1.2 Review of existing data

Existing background noise data from the Parallel Runway EIS/MDP (BAC 2006) has been used as an indication of the current background noise levels within proximity to the Project site. Ambient noise levels at a number of locations surrounding the airport site in November 2005 were recorded.

The nearest locations with background noise data to the Project site are:

- St Paul's Theological College (2.5 km north west) – recorded distant traffic and birds
- 33 Franklin Street, Nundah (2.45 km west) – recorded distant traffic, insects, birds and occasional local traffic
- 17 McBride Road, Pinkenba (2.6 km south east) – recorded birds, insects, children, animals and aircraft noise

The ambient noise levels recorded as part of studies for the Parallel Runway EIS/MDP relevant to the current Project site are outlined in Table 9.2.

It is noted that the Parallel Runway EIS/MDP considered these noise levels to be typical for these areas (BAC 2006).

Table 9.2 Summary of measured noise levels

Site	min$L_{A90,1hr}$ (dBA)			$L_{Aeq,Period}$ (dBA)		
	Daytime 7 am-6 pm	Evening 6-10pm	Nightime 10 pm-7 am	Daytime 7 am-6 pm	Evening 6-10 pm	Nightime 10 pm-7 am
St Paul's Theological College (Educational facility)	36	33	30	56	51	44
33 Franklin Street, Nundah (residential property)	44	42	36	57	50	49
17 McBride Road, Pinkenba (residential property)	42	37	34	57	52	51

Source: BAC 2006

9.4.2 Vibration

Vibration monitoring inside the Kingsford Smith Memorial was conducted during the construction works at the Brisbane Airport Northern Access Road Project (eg Nancy Bird Way) during various vibration inducing works (eg roller operation, pile driving). Table 9.3 details the results from the vibration monitoring. The maximum vibration result was detected at -1.1 mm/s, significantly below the recommended vibration criteria (5 mm/s). This maximum result was detected during setup of the vibration monitor and is likely to be attributed to the set up process as it is unusually high (Leighton Contractors 2009).

Table 9.3 Vibration results during Brisbane Airport Northern Access Road Project

Monitoring period	Maximum vibration detected (mm/s)
24 March to 5 April 2009	0.4
17 to 19 April 2009	0.4
28 to 30 April 2009	Not detected
25 to 26 May 2009	0.05
7 to 15 July 2009 and 20 to 26 July 2009	-1.1

9.5 Potential impacts

9.5.1 Potential noise impacts

The Project may undertake a 24 hour earthwork operations as well as material processing, including sorting, crushing, screening and stockpiling.

Sources of construction noise during the Project will comprise a range of heavy vehicles, plant and equipment, and typically occurs intermittently and varies depending upon the nature or phase of construction (ie land clearing, excavation etc). In general, the site clearance and earthworks activities can be viewed as an intense activity of work over a short timescale in the Project site. These works are unlikely to be in the same vicinity for more than a few days at a time.

Rock crushing may be undertaken during the bulk earthworks. The location for rock crushing would be chosen based on distance to material, accessibility of trucks and location of neighbouring receptors, such as the Kingsford Smith Memorial.

Based on the typical sound power levels for construction sources, noise level predictions have been undertaken assuming all listed equipment is operating simultaneously at 100% capacity (ie worst case scenario). This conservative assessment is shown in Table 9.4 below.

Table 9.4 Noise level predictions

Activity	Equipment	No. of items in one 15 min period	Typical Sound Power Level (mid-point) (dBA)		Calculated construction noise levels, $L_{Aeq,15\ mins}$ dB(A) at distance:							
			Individual item	Total item	25m	50m	100m	200m	400m	500m	800m	1km
Bulk earthworks with rock crushing	Rock breaker	1	118	118	82	76	70	64	58	56	52	50
	Bulldozers/ tracked loaders	2	108	111	75	69	63	57	51	49	45	43
	Excavators	3	107	112	76	70	64	58	52	50	46	44
	Dump trucks	4	117	123	87	81	75	69	63	61	57	55
	Drum rollers	3	108	113	77	71	65	59	53	51	47	45
	Articulated truck	1	107	107	71	65	59	53	47	45	41	39
	Water trucks	2	107	110	74	68	62	56	50	48	44	42
Cumulative noise from all equipment in dB(A)					89	83	77	71	65	63	59	57
Overall noise level (*+10 dB penalty for annoying characteristics*) in dB(A)					99	93	87	81	75	73	69	67
Expected noise exceedance (against 75 dBA*)**:**					**24**	**18**	**12**	**6**	0	-2	-6	-8

Table notes:
The *Guideline: Planning for noise control* (EHP 2016c) states that 5 dBA penalty each should be applied for impulsiveness and reverse beeping
*As per the AEPR, noise generated from construction of a structure at an airport should not exceed 75 dBA at the site of a sensitive receptor (refer Table 9.1)

The closest receptors to the Project site, where the most noise is likely to be experienced given the combination of activities and potential for rock processing, are outlined in Section 9.4.1 and include the Kingsford Smith Memorial, the Brisbane Airport Services Centre and the CPA. While there is potential for the Project to exceed the AEPR criteria at these locations, as they are all located within 100 m of the Project site (refer Table 9.4), this information is conservative and peak noise levels would occur only sporadically since not all equipment would be operating at all times and mitigation measures will be put in place. Based on this, it is likely that potential impacts to these receptors from Project works can be managed with appropriate mitigation measures outlined in Table 9.6.

It is considered that the residential areas (Eagle Farm, Hendra, Nundah, Northgate and Banyo) are a sufficient distance away from the Project site and will not experience any noise impacts as a result of the Project.

Noise impacts may also be associated with construction vehicle traffic. Traffic due to workforce movements and delivery of materials will increase the ambient noise levels on site and adjoining access routes. However it is not expected that any change in noise will be noticeable given that access routes are currently busy road corridors.

9.5.2 Potential vibration impacts

Ground vibration resulting from the construction works will mainly be associated with the excavation/compacting for earthworks and rock crushing activities. The major vibration sources will include the operation of bulldozers, excavators, vibratory rollers (if used) and the rock crushing equipment.

The ground vibration levels due to construction work are difficult to be predicted accurately due to the dependence of vibration transmissibility on soil type (soft or hard), intervening geology (ie the coupling loss between the soil and the building foundation), the nature of the building foundations and the location of the construction equipment.

The nearest potential affected properties are outlined in Section 9.4.1 and include the Kingsford Smith Memorial, the Brisbane Airport Services Centre and the CPA. At these receptors, there may be occasions when vibration is perceptible during intensive earthworks.

An example of predicted ground vibrations at various distances was made by GHD and the Roads Traffic Authority (RTA) (now Roads and Maritime Services [RMS]) (GHD and RTA 2014) using data from the Environmental Noise Management Manual (RTA 2001). This data, shown in Table 9.5 below, provides an example of the levels of ground vibration that could be expected during construction of the Project.

Table 9.5 Typical vibration levels at distances (mm/s peak)

Plant item	Distance from source			
	10 m	20 m	50 m	100 m
15 t roller	7 to 8	3.8	1.5	0.8
7 t compactor	5 to 7	3.0	1.2	0.6
Dozer	2.5 to 4	1.6	0.7	0.3
Backhoe	1.0	0.5	0.2	0.1

Source: GHD and RTA 2014

As discussed in Section 9.5.1, the Kingsford Smith Memorial, Brisbane Airport Services Centre and Central Parking Area are located within approximately 100 m of the Project site boundary. At a distance of 20 m, construction vibration levels for a 15 t roller and a dozer are in the order of 3.8 mm/s and 1.6 mm/s peak respectively, which are below the 5 mm/s limit recommended in Section 9.3.3.

Vibration monitoring was conducted at the Kingsford Smith Memorial during the Northern Access Road Project and detected a maximum vibration result of -1.1 mm/s (Leighton Contractors 2009). This result is significantly below the recommended vibration criteria (5 mm/s). Piling activities and vibratory rollers were used in closer vicinity of the Kingsford Smith Memorial during the Northern Access Road Project. However, the Project will not involve piling, vibratory rollers will be avoided where possible and the Project site is located a further distance from the Kingsford Smith Memorial (approximately 95 m). Based on this, it is considered unlikely that there will be any construction related vibration impacts on these neighbouring receptors as a result of the Project.

It is considered that the residential areas (Eagle Farm, Hendra, Nundah, Northgate and Banyo) are a sufficient distance away from the Project site and will not be impacted as a result of vibration generated by the Project.

9.6 Mitigation measures

A summary of each of the predicted impacts related to noise and vibration and the environmental management measures for the earthworks phase of the Project is provided in Table 9.6.

Table 9.6 Noise and vibration potential impacts and mitigation measures

Potential environmental aspect/impact	Management objective	Action	Phase to be implemented	Outcome
Noise				
Generation of noise during construction of the Project	Advise adjacent tenants of the potential noise impacts that may occur during construction	■ Provide advance notice to, and regular communication with, existing potential affected tenants before and throughout the construction period	Prior to and during construction	To be addressed during detailed design phase and construction
	Undertake a background noise monitoring program for the Project	■ Noise monitoring to be undertaken to collect information that can inform consultation with neighbouring tenants, if required, and to provide a benchmark to assess construction noise monitoring results against. Undertake baseline noise monitoring at the Kingsford Smith Memorial and the Brisbane Airport Services Centre at least two weeks prior to the commencement of construction (refer Figure 7.1). The following should be undertaken: – A battery powered noise logger should be used – Noise data collection and analysis to be done in accordance with AS 1055.1 Acoustics – Description and measurement of environmental noise – To be undertaken in accordance with the *Noise Measurement Manual* (EHP 2013)	Prior to construction	Requirement to be included in the EMP

Potential environmental aspect/impact	Management objective	Action	Phase to be implemented	Outcome
	Implement a range of techniques to minimise noise impacts as a result of bulk earthworks activities, including rock crushing	■ If required, (eg a validated complaint is received or an exceedance of the limits set out in this EAR are confirmed), an investigation will be undertaken to determine the source of the exceedance/complaint. ■ Where possible and practicable, noise machinery should have appropriate mufflers, silencers and/or enclosures fitted to reduce noise transmission ■ Avoid noisy plant/machines working simultaneously close together and adjacent to sensitive receivers ■ Ensure all equipment is limited to an instantaneous sound pressure level at 15 m of L_{max} 85 dBA (under worst case operating mode), either by fitting silencers/shrouds to existing equipment or by using updated equipment ■ Where possible, locate and operate any constant noise sources (ie generators) as far as possible from adjacent or nearby premises and the Kingsford Smith Memorial ■ Excessively noisy machinery should preferably not operate during sensitive night time hours (ie between 10 pm and 7 am), and should be located as far as possible from the noise-sensitive premises. Wherever possible, restrict usage to daytime hours ■ Equipment used during Project works are to be operated and maintained in a proper and efficient manner to minimise noise levels ■ Equipment/machinery should be shut down when not in use	Construction	Requirement to be included in the EMP
Potential community complaints regarding noise	Manage and monitor noise at sensitive receptors who experience noise related impacts during the construction phase	■ Keep a register of noise related complaints and record the time and nature of the alleged incident to aid in complaint verification ■ Investigate the source of substantiated noise complaints ■ Within seven days of the noise complaint, report the results of the investigation and the actions taken to 'close out' the complaint to the complainant and BAC Environmental Advisor ■ Where noise complaints persist, undertake noise monitoring 1.0 m from the façade of affected properties to assess noise levels against the EPP (Noise) criteria and to assist with future management of noise complaints. Outside the hours of 7am to 7pm Monday to Saturday (excluding public holidays), if noise at sensitive receptors off Airport land continues to exceed the EPP (Noise) criteria, the noise generating activity on the Project site will cease operations	Construction	Requirement to be included in the EMP

Potential environmental aspect/impact	Management objective	Action	Phase to be implemented	Outcome
Vibration				
Vibration from the construction phase leading to cosmetic damage to commercial buildings and sensitive receptors	Undertake a background vibration monitoring program for the Project	■ Background vibration monitoring to be undertaken to collect information that can inform consultation with neighbouring tenants, if required, and to provide a benchmark to assess construction vibration monitoring results against. Undertake baseline vibration monitoring inside the Kingsford Smith Memorial at least two weeks prior to the commencement of construction (refer Figure 7.1).	Prior to construction	Requirement to be included in the EMP
	Minimise the likelihood of damage to commercial buildings and sensitive receptors as a result of vibration from construction activities	■ Condition assessments of existing buildings within close proximity to the Project site, including the Kingsford Smith Memorial, will be undertaken prior to and during construction ■ Investigate the potential of using static rollers instead of vibratory rollers ■ Piling should not be undertaken within 200 m of the Kingsford Smith Memorial unless suitable control and monitoring are implemented ■ All machinery operating within 100 m of the Kingsford Smith Memorial is to be limited to 15 km/h with appropriate signage to be displayed ■ Advise stakeholders of upcoming works via regular stakeholder communications. Stakeholders will have the opportunity to discuss with BAC if there are any concerns. ■ During vibration inducing works within 200 m of the Kingsford Smith Memorial, and if a validated complaint regarding vibration is received, vibration monitoring shall be undertaken at the Kingsford Smith Memorial to ensure that vibration levels are kept below 5 mm/s in consultation with the BAC Environmental Advisor ■ As far as practical, all operations causing relatively high levels of vibration should be carried out at a time to cause the least annoyance to neighbours (eg daytime hours) ■ Where possible, locate and operate any constant vibration sources (eg generators), as far as possible from adjacent or nearby premises	Prior to construction, and during construction	Requirements to be included in the EMP

10 Social and economic issues

10.1 Introduction

This section provides a summary of the existing socio-economic environment relevant to the Project site. This provides an indication of who to target during stakeholder communication for the Project.

10.2 Methodology

A review of the legislation, policy and guidelines relevant to social and economic issues and stakeholder communication requirements for the Project has been undertaken. A review of the existing environment in relation to social and economic baseline conditions within and surrounding the Project site and stakeholder communication requirements on Airport land is provided.

The existing environment conditions have indicated the potential impacts that may occur during the construction of the Project. Mitigation measures are also recommended to be implemented during construction.

10.3 Relevant documents

10.3.1 Airport Development Consultation Guidelines

Requirements for engaging with the community related to airport development are included in the *Airport Development Consultation Guidelines* (Department of Infrastructure, Transport, Regional Development and Local Government 2012). The guidelines were prepared to assist Airport Lessee Companies that are managing and operating Australia's leased federal airports in the process of stakeholder consultation. The aim of the guidelines seek to outline how consultation processes in relation to land use, planning and developments at the leased federal airports should be managed, with particular emphasis on the preparation of Master Plans, Airport Environment Strategies and Major Development Plans.

A range of consultation approaches are suggested in the guidelines including:

- Public meetings
- Stakeholder meetings
- Focus group meetings
- On site meetings
- Permanent or ad hoc consultative committees
- Submissions
- Individual discussions

The choice of an appropriate approach depends on the type and location of the Project, the stakeholder group and their willingness to participate, the potential impact to the community/ environment, and statutory timeframes.

10.4 Existing environment

The nearest residential area are the suburbs of Nudgee (1.6 km north), Banyo (1.3 km north), Nundah (2.2 km west), Pinkenba (1.9 km south and east) and Eagle Farm (1.3 km south). The Gateway Motorway and industrial areas are located between the Project site and the nearest residential suburbs (refer Figure 8.1). Surrounding economic activities include:

- Kingsford Smith Memorial and Southern Cross Aircraft (95 m north east)
- Tenancies along Nancy Bird Way, such as:
  - Brisbane Airport Services Centre (directly across Nancy Bird Way, operating 6am to 10pm), including:
    - Shell Coles Express
    - McDonalds and other food outlets
    - Vehicle servicing precinct – Ultra Tune, Sparkles Car Wash
  - Thrifty Car Rental and Hire
  - CPA Remote Public Car Park (directly across Moreton Drive)
- Tenancies along Bert Hinkler Drive, such as:
  - CPA Staff Car Park Stages 1 and 2
  - CPA Staff Car Park Stages 3 and 4 (under construction)
  - Taxi, bus and limousine parking
- Tenancies along Ivy May Way such as:
  - Europcar Car Rental
  - Avis Car Rental
  - Budget Car Rental
  - Hertz Car Rental
  - Qantas Valet Storage Facility
- Tenancies within the International Terminal (across Airport Drive), such as:
  - Airtrain services
  - Secure car parking
  - International Terminal lounge, food and shopping outlets
- Commercial tenancies along Qantas Drive (across Airport Drive)
- Brisbane Domestic Terminal, including car parking and hire cars (approximately 1.8 km north east of the Project site)
- Direct Factory Outlet (1.6 km south-west)

The nearest sensitive receptors to the Project site include:

- Northgate State School (2.6 km west)
- Hendra State School (2.75 km south west)
- Novotel Hotel (1.8 km south west)
- Tadpoles and Joey Club Childcare Centre (2.1 km south west)
- Pullman and Ibis Hotel (1.5 km north) (under construction)

10.5 Potential impacts

10.5.1 Social and economic issues

The main social and economic issues for the Project are likely to include:

- Potential impacts to the Kingsford Smith Memorial and adjacent tenancies due to noise and vibration occurring as a result of construction activities
- Potential impacts to adjacent tenancies where the quality of the services provided by the businesses is compromised by dust on rental cars or cars that have been parked at the valet service
- The potential employment benefits from the construction of the Project and developments on the land
- Potential air quality impacts to the Kingsford Smith Memorial and adjacent tenancies and residences and aircraft operators
- Potential minor impacts to adjacent tenancy access and disruption to local road network

10.5.2 Stakeholder communications

There are a range of potential impacts to the surrounding stakeholders that may occur during construction of the Project. For the general community, BAC could make use of their current process in providing monthly traffic update brochures advising airport users and tenants about road works on-airport. BAC proposes to provide updates of upcoming Project works via regular stakeholder communications via BAC's normal avenues. If stakeholders have any concerns with the Project works, they will have the opportunity to discuss this with BAC.

Stakeholders within 1.0 km of the Project site will be informed of the Project and its potential impacts.

There is the potential to impact on surrounding tenancy accesses during construction of the Project. Mitigation measures to address traffic management are provided in Section 13.6, while general measures to address stakeholder concerns that may occur during construction are provided in Table 10.1. It should be noted that construction activities may result in air quality and noise and vibration impacts to adjacent tenancies and stakeholders (as discussed in Sections 8 and 9 respectively). Measures addressing air quality and noise and vibration issues are outlined in the mitigation tables provided in Sections 8.7 and 9.6, including complaint response procedures.

10.6 Mitigation measures

Mitigation measures to address air quality, noise and traffic management are provided in Sections 8, 9 and 13 respectively.

Table 10.1 provides a summary of the mitigation measures to be adopted during construction of the Project.

Table 10.1 Potential impacts and mitigation measures related to social and economic issues

Potential environmental aspect/ impact	Management objective	Action	Phase to be implemented	Outcome
Stakeholder concerns are not accounted for during the construction phase	Implement a plan to address stakeholder concerns in accordance with BAC's normal procedures	■ Supply updates on upcoming works via regular stakeholder communications through BAC's normal avenues ■ Stakeholders within 1.0 km of the Project site will be informed of the Project and its potential impacts	Prior to construction/ construction	BAC to advise stakeholders before construction commences and then followed by regular Project updates during construction
Access arrangements during construction works, such as diversion of existing streets	Ensure that access impacts are managed appropriately	■ Ensure access for infrastructure maintenance (eg Energex substation etc) is maintained throughout Project works ■ Temporary construction, pedestrian, vehicle access and parking arrangements to be planned and scheduled to minimise possible impacts to surrounding tenants and road users, if needed ■ Prepare and distribute advice to stakeholders regarding road closures (if required) and changes to access arrangements	Prior to construction/ construction	BAC to address prior to construction, so that arrangements can be made during the construction phase

11 Cultural heritage

11.1 Introduction

An assessment of the potential historical heritage issues within the Project site has been undertaken by Converge Heritage and Community (Converge) and is summarised in the following sections. These sections also detail Indigenous cultural heritage associated with the Project site. The Brisbane Airport Auto Mall Heritage Report prepared by Converge is provided in Appendix J.

11.2 Methodology

The cultural heritage assessment comprised a desktop assessment by Converge. It is noted that Converge have extensive previous experience at Brisbane Airport and previously prepared the Heritage Management Plan.

A desktop assessment was undertaken to determine the presence, extent and likelihood of significance of any places likely to be located within the Project site. This assessment comprised searches of statutory and non-statutory registers and databases, and a review of existing published and unpublished reports, surveys and assessments of the Project site and the surrounding area.

The findings from this desktop assessment informed the potential impacts that Projects works may have on cultural heritage. Mitigation measures were developed to manage the potential impacts on cultural heritage.

11.3 Relevant documents

The key commonwealth legislation for the protection of Indigenous and non-Indigenous cultural heritage is the EPBC Act, which administers the National Heritage List and the Commonwealth Heritage List. Other commonwealth legislation includes the *Protection of Moveable Cultural Heritage Act 1986*, which regulates the export of Australia's significant cultural heritage objects, and the *Australian Heritage Council Act 2003*, which established the Australian Heritage Council to advise the Australian Government on heritage matters and administers the former Register of the National Estate and the Australian Heritage Places Inventory.

The QH Act manages places of state heritage significance in Queensland and established the Queensland Heritage Council and the Queensland Heritage Register. Indigenous cultural heritage is managed under the ACH Act and legislates the 'cultural heritage duty of care' to ensure all persons undertaking an activity 'take all reasonable and practicable measures to ensure the activity does not harm Aboriginal cultural heritage'.

Local heritage is managed under the BCC planning scheme, *Brisbane City Plan 2014*.

Other registers used during the desktop assessment included the Queensland National Trust Register and Monument Australia.

The following previous reports relevant to historical heritage at Brisbane Airport were considered by Converge during the desktop assessment include (refer Appendix J):

- Brisbane Airport Heritage Management Plan (Converge 2016)

- AES Cultural Heritage Chapter
- New Parallel Runway Project (BAC 2006)
- Kingsford Smith Memorial, Brisbane Artefact Condition Report (Leighton Contractors 2008)
- Kingsford Smith Memorial, Brisbane Post NARP Artefact Condition Report (Leighton Contractors 2009)

11.4 Existing environment

11.4.1 Site history

The Brisbane Airport services domestic and international passengers, with the majority of Airport land having become heavily industrialised. The surrounding developments associated with the airport include terminal buildings, maintenance facilities, car parking, extensive road networks, and communication, water and sewerage lines. Prior to its current use, the Brisbane Airport had been subject to a number of different land uses and development activities.

Prior to European settlement, the airport site and surrounding areas provided a natural environment rich in a variety of food, resources and useful materials for Indigenous communities in the region. European settlement of the area began with a convict settlement in the location of the former Eagle Farm Airport. The current airport site was used for agriculture and included the former township of Cribb Island (BAC 2014a). In World War II, the airport site was used for military purposes. The Heritage Report provided in Appendix J further details the site history.

11.4.2 Heritage registers

Converge conducted a search of various heritage registers and databases for historic heritage in the vicinity of the Project site (refer Appendix J). The findings of these searches are summarised in Table 11.1.

Table 11.1 Heritage register and database search results

Place	Heritage register /database	Statutory (Y/N)	Distance from Project site	Relevant to Project (Y/N)
Eagle Farm Women's Prison and Factory Site	Queensland Heritage Register (ID 600186) Register of the National Estate (ID 16490) Commonwealth Heritage List (ID 105478) National Trust of Queensland Register (ID BNE 1/134)	Y	Located 2 km from Project site	N
Allison Testing Stands (former)	Queensland Heritage Register (ID 602329)	Y	Located 2 km from Project site	N
Second World War Hangar No. 7	Queensland Heritage Register (ID 601007) Register of the National Estate (ID 18174) Commonwealth Heritage List (ID 105407) National Trust of Queensland Register (ID BNE 1/805).	Y	Located 2.5 km from Project site	N
Brisbane Domestic Air Terminal (former)	National Trust of Queensland Register (ID BNE 1/916)	N	Possibly demolished	N
Australian Airlines Baggage Collection (former)	National Trust of Queensland Register (ID BNE 1/917)	N	Possibly demolished	N
Aircraft Hangar 2 (former)	National Trust of Queensland Register (ID BNE 1/918)	N	Possibly demolished	N
Aircraft Hangar 1 (former)	National Trust of Queensland Register (ID BNE 1/919)	N	Possibly demolished	N

Place	Heritage register /database	Statutory (Y/N)	Distance from Project site	Relevant to Project (Y/N)
Sir Charles Kingsford Smith Memorial	Monument Australia	N	Located 95 m from Project site	Y
460 Squadron Memorial	Monument Australia	N	Located 100 m from Project site	Y

Converge determined that the Project site has little to no heritage value, although it has potential to contain items or sites that may be unearthed during construction. The Kingsford Smith Memorial, which contains the Southern Cross Aircraft, is potentially significant at a State or Commonwealth level for its historic significance, rarity, aesthetics, technical achievements and associative values. It is not currently listed on any statutory heritage register.

Converge also found that the Squadron 460 Memorial has some local heritage value, although it is not listed on any statutory heritage register.

The full assessment of the heritage significance of the Project site is provided in Appendix J.

11.5 Potential impacts

The Project works will involve bulk earthworks on land that has previously been filled. In addition, it is expected that there will be limited excavations required for the Project. Potential heritage sites/places within the Project site may include survey trees, remnant fence lines and historic drains and culverts. However, it is considered there is limited potential for Project works to impact on cultural heritage within the Project site.

Consideration has been given to the potential for emissions associated with Project works, such as vibration and dust, to impact on the Kingsford Smith Memorial. Previous projects undertaken near the Memorial, including the Northern Access Road Project (which involved pile driving in association with construction of the Nancy Bird Way bridge), did not result in any impacts from dust or vibration or complaints relating to the heritage values associated with the Memorial. It is noted that the Auto Mall Project is located further from the Kingsford Smith Memorial than the Northern Access Road Project and does not involve pile driving. As such, it is considered that compliance with the recommendations of the Brisbane Airport Auto Mall Heritage Report (Converge 2017; Appendix J) will ensure the works do not adversely impact the Kingsford Smith Memorial.

11.6 Mitigation measures

Table 11.2 provides a summary of the mitigation measures to be adopted during construction of the Project.

Table 11.2 Cultural heritage management measures

Potential environmental aspect/ impact	Management objective	Action	Phase to be implemented	Outcome
Cultural heritage find is made during construction on the Project site	Ensure all staff have completed a site induction	■ Site induction to include: – Cultural heritage awareness training – Familiarisation material to identify a cultural heritage find – Stop Work Procedure under the Heritage Management Plan – Process for collection, transport and storage of any cultural heritage finds	Construction	Requirements to be included in the EMP
	Implement the Stop Work Procedure and ensure no impact is sustained to cultural heritage	■ Should unexpected cultural heritage material be encountered during Project works, the Stop Work Procedure, as identified in the Brisbane Airport Heritage Management Plan, is to be implemented	Construction	Requirements to be included in the EMP Stop Work Procedure to be included in the EMP
Dust and vibration impacts at the Kingsford Smith Memorial as a result of Project works	Implement dust and vibration mitigation measures during construction	■ Prior to the commencement of Project works, conduct a building assessment on the Kingsford Smith Memorial and repair/replace all door seals and building joints as required ■ Implement the air quality mitigation measures and undertake dust monitoring, as per the measures outlined in Section 8.7 ■ Implement mitigation measures for vibration and undertake vibration monitoring during all vibration inducing works near the Kingsford Smith Memorial, as per the measures outlined in Section 9.6	Prior to construction and during construction	Requirements to be included in the EMP

12 Waste and hazardous goods management

12.1 Introduction

This section outlines the waste types and streams, and management measures to be applied during the construction of the Project. Reference is made to the relevant legislative requirements, as well as industry best practice.

12.2 Methodology

A desktop review of the waste related legislation and policy was undertaken to determine its applicability to the Project. Waste streams that are anticipated to be generated during construction were identified. This assisted with the identification of requirements for management of waste in the Project site.

12.3 Relevant documents

A background to legislation relevant to Airport land is provided in Section 3. Specific details related to waste management are discussed in this section.

12.3.1 Brisbane Airport Environment Strategy

Under the AES (BAC 2014), the action plan for waste management seeks to achieve the sustainable management of waste through initiatives such as waste minimisation and segregation of waste and recycling. The AES gives consideration to the *Waste Reduction and Recycling Act 2011* when managing waste on Airport land.

12.3.2 Waste Reduction and Recycling Act 2011

The EP Act defines a hazardous contaminant as being *a contaminant, other than an item of explosive ordnance that, if improperly treated, stored, disposed of or otherwise managed, is likely to cause serious or material environmental harm because of:*

- *its quantity, concentration, acute or chronic toxic effects, carcinogenicity, teratogenicity, mutagenicity, corrosiveness, explosiveness, radioactivity or flammability; or*
- *its physical, chemical or infectious characteristics*

Waste is divided into ‘regulated waste’ as defined below and ‘general waste’ which is defined as waste other than regulated waste. Regulated waste is defined in the EP Reg as:

(a) Commercial or industrial waste, whether or not it has been immobilised or treated; and

(b) Is of a type, or contains a constituent of a type, mentioned in schedule 7, part 1.

Regulated waste includes contaminated soils.

Under the *Waste Reduction and Recycling Act 2011*, priority wastes are those with high disposal impacts (eg toxicity or greenhouse emissions), social impacts (eg amenity or community concern) or whose recovery would present resource savings or business opportunities. Queensland's priority wastes include:

- Plastic waste
- Organic waste
- High volume wastes (eg concrete, treated timber, plasterboard)
- Reginal impact waste (eg mining and industrial development, mattresses, orphan agricultural and veterinary chemicals)
- Fluorescent lights, used tyres, used oil

12.3.3 Work Health and Safety Act 2011

The management of hazardous goods must be in accordance with the *Work Health and Safety Act 2011* (WHS Act). Discussion regarding potential contamination on the site is provided in Section 5. An ACM Management Plan has been developed for the Project, including requirements for asbestos removal and/or encapsulation of ACM on site (refer Appendix G).

Contractors are responsible for any licences required under the WHS Act. Hazardous goods will be handled, stored and disposed of in accordance with the WHS Act.

12.4 Existing environment

Existing vegetation, ground cover and soil are potential waste sources if not managed correctly. Potential waste streams to be managed during construction include:

- Packaging materials – any materials used on site that are delivered in packaging material. This includes pallets, crates, cartons, plastics and wrapping materials. All packaging material will need to be disposed of once the product has been used
- Importation of fill – any excess fill that has been imported to the Project site may either be graded or removed from the site
- Exporting of fill – existing fill unsuitable for use as surcharging material. Excess fill not needed on site
- Demolition wastes – this includes shrubs and trees and any drainage infrastructure that may need to be replaced
- Wastes from construction equipment maintenance – various heavy vehicles and construction equipment will be utilised for the duration of the construction phase. Liquid hazardous wastes from cleaning, repairing and maintenance of equipment may be generated. Leakage or spillage of fuels/oils within the site needs to be managed and wastes disposed of appropriately
- Regulated wastes – including hydrocarbon waste such as waste oil, oily water, oily sludge, grease, coolant, oily rags, oil filters, drums, detergent, solvents, batteries, tyres, paints and resins
- General wastes – this includes office wastes, scrap materials and biodegradable wastes
- Vegetation wastes – cleared vegetation, including ground covers, trees and shrubs and declared weeds

12.5 Potential impacts

A range of potential impacts may occur due to poor waste management during construction of the Project:

- Ground contamination and water quality impacts as a result of construction waste
- Unnecessary waste generated as a result of inadequate waste management practices
- Water quality impacts due to poor waste management during construction

- Water quality and ground contamination impacts as a result of spillage of hazardous goods
- Amenity issues for surrounding land users

12.6 Mitigation measures

Potential impacts relating to the management of waste within the Project site and recommended mitigation measures are outlined in Table 12.1.

Table 12.1 Waste potential impacts and mitigation measures

Potential environmental aspect/ impact	Management objective	Action	Phase to be implemented	Outcome
Ground contamination and water quality impacts as a result of demolition and construction wastes	Maximise the opportunities for reuse of existing materials in the design phase	■ Identify possible secondary uses for construction wastes prior to and during construction ■ Designate location of construction compounds and areas for each waste stream to allow for waste segregation ■ Re-use surcharge and stockpile materials from other project sites at BAC if possible	Construction	To be addressed in the EMP
	Manage the storage and disposal of necessary construction waste	■ Ensure construction and industrial waste is stored in industrial covered skips/bins ■ Contain and capture runoff from designated waste areas ■ No waste is to be burnt on site	Construction	Requirements to be included in the EMP
Unnecessary waste generated as a result of inadequate waste management practices	Adopt appropriate waste management practices during construction	■ Develop and implement a waste management plan for the Project as part of the EMP ■ Implement the ACM Management Plan for the Project ■ If possible, vegetation wastes from site clearing to be used in on site landscaping and erosion and sediment activities ■ Weed management to be undertaken in accordance with requirements outlined in Section 6.5 ■ Ensure waste bin lids are closed and work sites kept tidy to avoid littering and attraction of birds, vermin and other wildlife ■ Any packaging materials to be collected separately and re-used or recycled including timber, paper, cardboard, pallets and plastics ■ Waste disposal is to occur at approved facilities ■ Engage the services of a licensed waste contractor and recycler if removing regulated wastes from the Project site ■ Ensure excess imported fill or unsuitable surcharging material is removed from site upon completion ■ Regulated waste is to be managed and disposed of in accordance with regulatory requirements and the EMP. Licensed contractor is to remove regulated waste from site, and provide EHP's trackable waste forms to BAC for their records	Construction	Requirements to be included in the EMP Waste Management Plan to be incorporated as a sub-plan under the EMP

Potential environmental aspect/ impact	Management objective	Action	Phase to be implemented	Outcome
Water quality impacts due to poor waste management during construction	Manage necessary waste stockpiles and storage areas, particularly adjacent to sensitive land uses and waterways	Contractor is to undertake/ensure: ■ Wastes separated for reuse ■ Erosion and sediment control measures are implemented ■ Stockpiles separated from other wastes ■ Stockpiles are to have appropriate sediment runoff controls to reduce contaminants leaving the Project site and to ensure contaminants are contained during construction. Note, the Project site will be isolated from external waterways during earthworks construction.	Construction	Requirements to be included in the EMP
Water quality and ground contamination impacts as a result of spillage of hazardous goods	Reduce the potential for water quality and ground contamination impacts due to spillages of hazardous goods	Construction specification requirements are outlined in Section 5.6	Construction	Requirements to be included in the EMP

13 Traffic and aviation safety

13.1 Introduction

This section outlines the potential issues relating to traffic impacts and aviation safety associated with the Project and discusses appropriate mitigation measures to be undertaken during the construction stages.

13.2 Methodology

A review of relevant information and studies relating to traffic impacts and aviation safety during construction was conducted, identifying the applicable information to be applied to the Project. The assessment of the existing environment was based on desktop studies and traffic counts on Airport Drive and Nancy Bird Way provided by BAC.

It is to be noted that traffic impacts has been undertaken for the site clearing and earthworks component only for this Project, across the three stages of construction.

13.3 Relevant documents

Legislation relevant to the Project is summarised in Section 3 of this EAR.

Relevant documentation related to the traffic assessment can be found within the following sections.

13.3.1 Traffic volumes

Existing mid-block traffic volumes for Nancy Bird Way and Airport Drive dated the week commencing 19 December 2016 have been provided by BAC.

The Engineering Concept Design Report (Opus 2016) has been used as the basis for the excavation and fill requirements for construction (refer Section 2.4).

13.3.2 Aviation safety

Certain airspace around Brisbane Airport (known as 'prescribed airspace') is protected under the *Airports (Protection of Airspace) Regulations 1996*. The prescribed airspace is made up of:

- The OLS and Procedures for Air Navigation Services Aircraft Operations (PANS-OPS) surfaces and the airspace above those surfaces, for existing and future air transport operations into and out of Brisbane Airport
- Any additional airspace that has been declared under the regulations by the Secretary of the DIRD

These matters are discussed in relation to the existing situation at Brisbane Airport in Section 13.4.3 below. As discussed in Section 3.2.1, Sections 182 and 183 the Airports Act requires a person to obtain approval to undertake controlled activities within the prescribed airspace. The controlled activities that potentially apply to the Project include:

c) *any other activity that causes a thing attached to, or in physical contact with, the ground to intrude into the prescribed airspace*

d) operating a source of artificial light, where:

i the intensity of the light emitted exceeds the level ascertained in accordance with the regulations; and

ii. the light is capable of blinding or confusing pilots of aircraft operating in the prescribed airspace

g) an activity that results in the emission of smoke, dust or other particulate matter, where:

i. the emission exceeds the level ascertained in accordance with the regulations; and

ii. the smoke, dust or particulate matter is capable of affecting the ability of aircraft to operate in the prescribed airspace in accordance with Visual Flight Rules

An application for a controlled activity approval must be submitted to the Secretary of the DIRD at least 28 days before the intended commencement of the controlled activity.

13.4 Existing environment

13.4.1 Local road network

The Project site is enclosed by Moreton Drive, Airport Drive and Nancy Bird Way and located in close proximity to the Brisbane International Terminal (Airport Central Precinct) (refer Figure 1.1).

13.4.1.1 Moreton Drive

Moreton Drive is a BAC controlled, four lane divided road running north – south, providing the main access route to the Brisbane Domestic Terminal and an alternative route to the Brisbane International Terminal from the Gateway Motorway via Nancy Bird Way.

13.4.1.2 Airport Drive

Airport Drive is a BAC controlled, four lane median divided road running parallel to Moreton Drive, providing the main access route to the Brisbane International Terminal and an alternative route to the Brisbane Domestic Terminal.

13.4.1.3 Nancy Bird Way

Nancy Bird Way is a BAC controlled, four lane two-way road running east-west, connecting Moreton Drive and Airport Drive. It currently provides access to the AIRPARK precinct as well as the Brisbane Airport Service Centre.

13.4.2 Existing traffic volumes

Vehicle Volume Streams Reports were provided for northbound and southbound directions along Airport Drive, and eastbound and westbound directions along Nancy Bird Way as presented within Figure 13.1 from 19 to 25 December 2016.

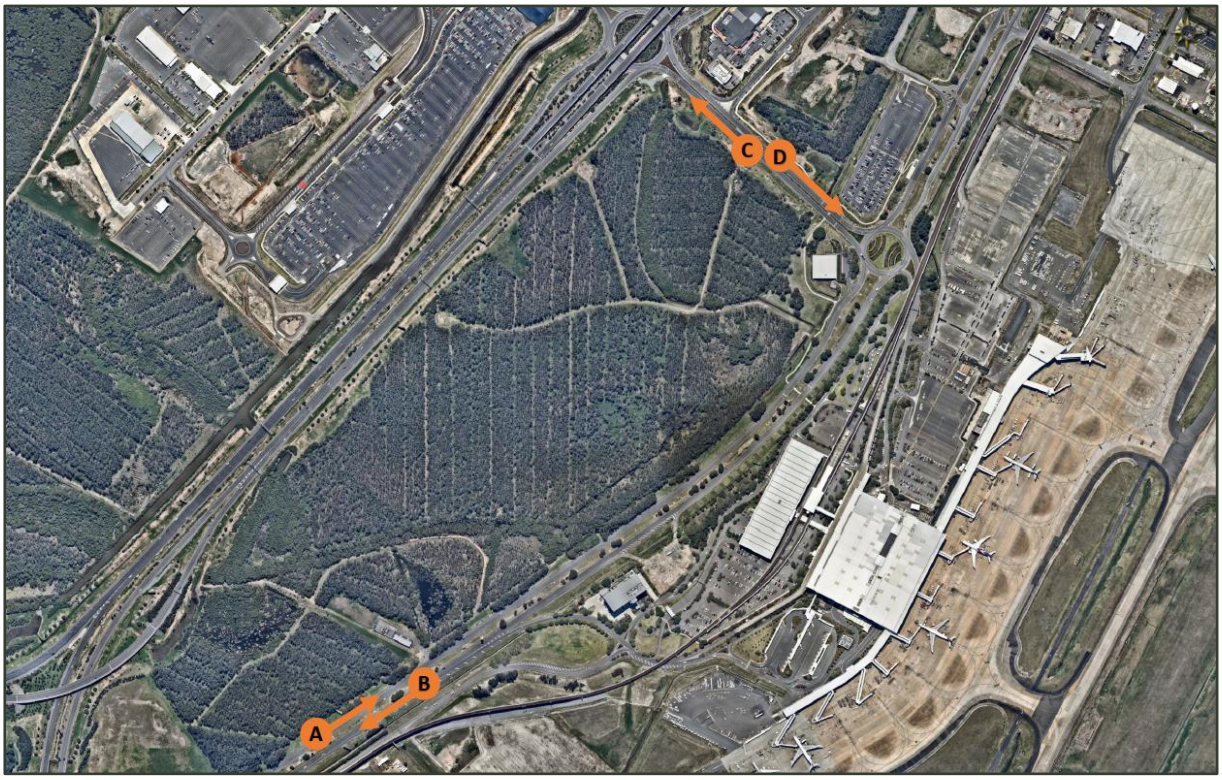

Figure 13.1 Streams traffic data locations provided by BAC

A summary of the Average Annual Daily Traffic (AADT), maximum peak hour, 12 hour total and 24 hour total traffic volumes taken from the vehicle volume reports is presented within the Table 13.1.

Table 13.1 Existing traffic volume summary (based on 19 to 25 December 2016)

Location	AADT	Maximum hourly volume (peak hour)	Maximum total 12 hour volume	Maximum total 24 hour volume
A (Airport Drive NB)	5,280	633 (06:00 – 07:00)	3,703	5,807
B (Airport Drive SB)	4,170	432 (12:00 – 13:00)	3,772	5,019
C (Nancy Bird Way WB)	4,564	366 (07:00 – 08:00)	3,371	5,136
D (Nancy Bird Way EB)	10,324	955 (06:00 – 07:00)	7,597	11,637

13.4.3 Aviation safety

13.4.3.1 Obstacle Limitation Surface and PANS-OPS surface

The OLS are conceptual (imaginary) surfaces associated with a runway, which identify the lower limits of the aerodrome airspace above which objects become obstacles to aircraft operations, and must be reported to CASA. Any obstacle close to or penetrating the OLS may need to be marked and/or lit in accordance with CASA requirements. Chapter 8 of the *Manual of Standards Part 139 – Aerodromes* states that the aerodrome operator must submit details of obstacles to CASA for hazard assessment and particular requirements for marking and lighting.

According to the BAC 2014 Master Plan, the PANS-OPS are surfaces that cannot be infringed on a permanent basis in any circumstances. An aircraft is to have a specified minimum clearance above any accountable obstacle in situations where the pilot is relying entirely on the information derived from cockpit instruments and may have no external visual reference to the ground, to obstacles or to other aircraft. The minimum obstacle clearance requirement is added to the height of the tallest object under the PANS-OPS surface to determine the minimum or lowest safe altitude to which a pilot may descend in attempting to establish visual reference to the airport.

According to the BAC Master Plan, the Project site is not located in the OLS or PANS-OPS for the current runway. However, the Project site would be located within the OLS and PANS-OPS of the future parallel runway, which will become operational in 2020. Figures 13.2 and 13.3 below show the mapping for the OLS and PANS-OPS respectively covering the Project site. The southern portion of the Project site is within the 35 to 47.5 m OLS contour. The north eastern portion of the Project site is within the 50 to 98 m Australian Height Datum (AHD) PANS-OPS zone and the south western portion of the Project site is within the 3.9 to 98 m AHD PANS-OPS zone.

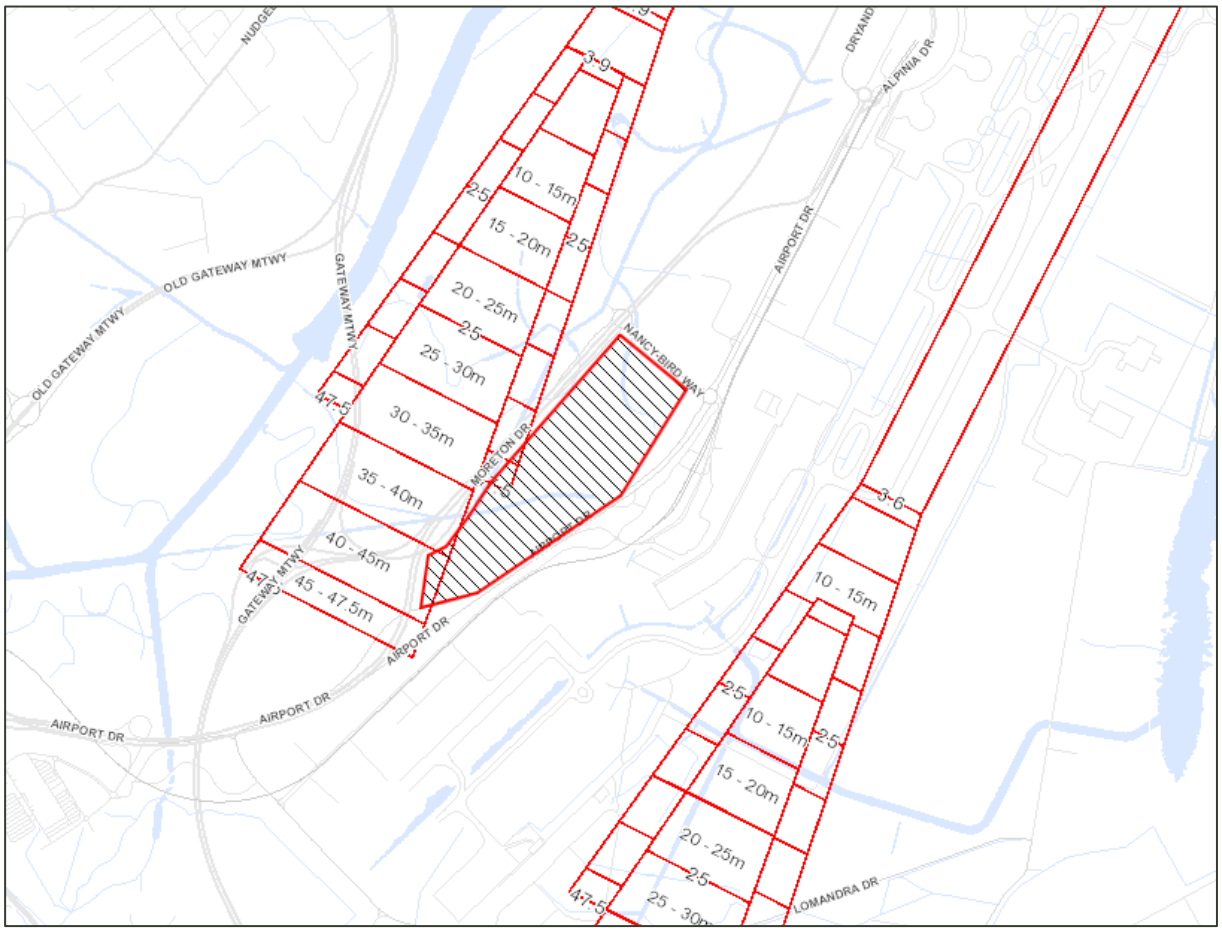

Figure 13.2 Prescribed airspace covering the Project site (hatched area)

Source: BCC 2014

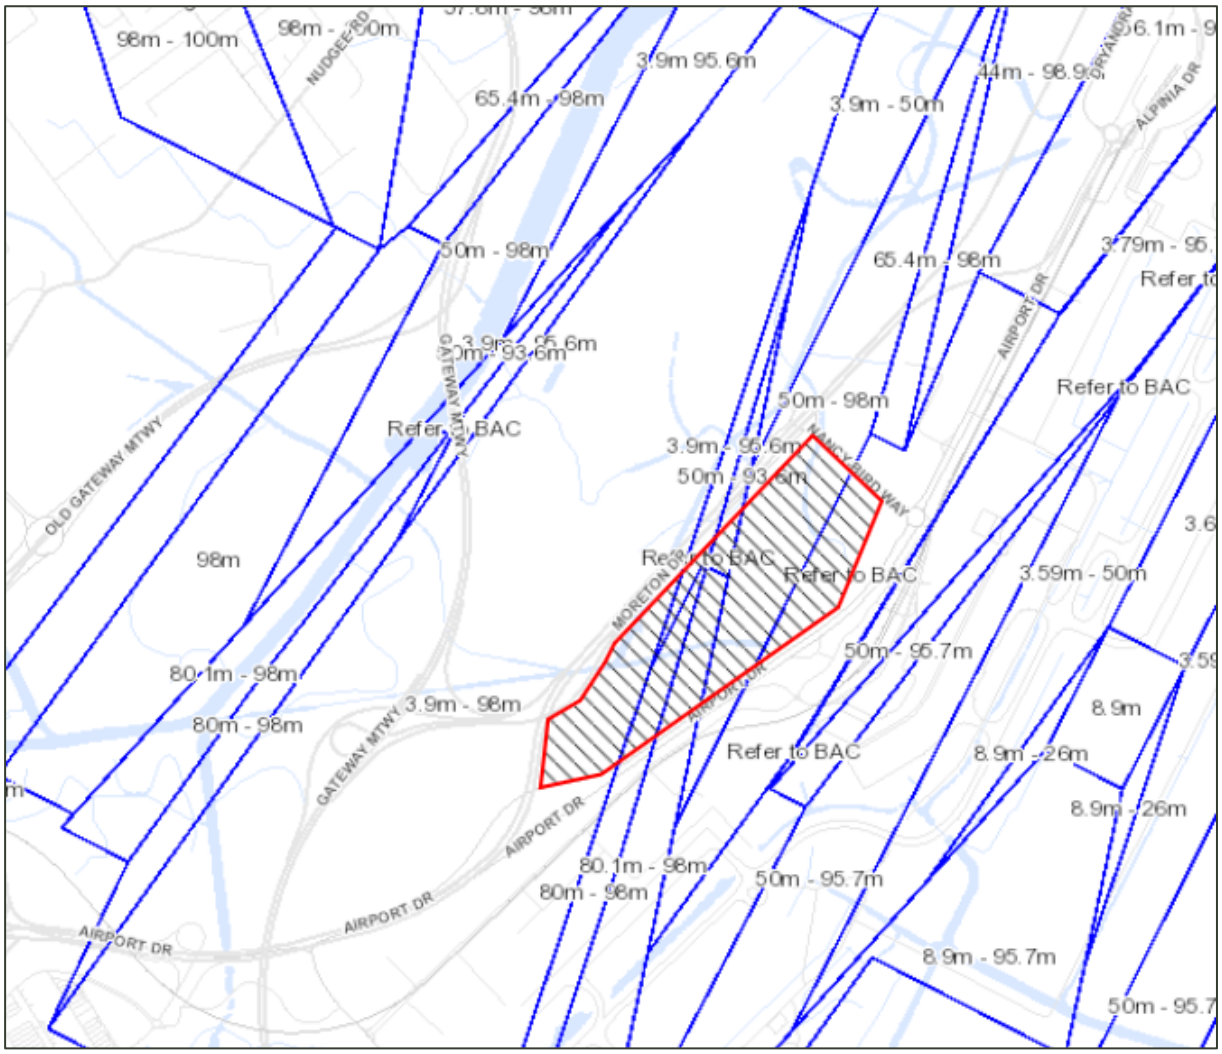

Figure 13.3 Procedures for air navigation surfaces covering the Project site (hatched area)

Source: BCC 2014

Construction plant and equipment operating in 2020 and beyond will not encroach into the prescribed airspace for the future parallel runway. However an assessment of construction plant and equipment will be conducted upon commencement of the works and if in exceedance of the OLS contour, an approval will need to be sought from the Secretary of the DIRD under the Airports Act to undertake a controlled activity if required.

It should be noted that the construction of buildings within the Project site does not form part of this EAR.

13.4.3.2 Lighting and reflection

The use of lighting around Brisbane Airport would be a concern in the following instances:

- If bright lights (eg floodlights) emit too much light above the horizontal plane, there is a possibility that a pilot could be dazzled, and momentarily unable to read cockpit instruments
- Lights may impact on air traffic controllers' ability to clearly see aircraft approaching the airport
- Lights may create a pattern that looks similar in appearance to approach or runway lighting, potentially causing confusion for pilots.

CASA has powers to regulate hazardous lighting under the *Civil Aviation Safety Regulations 1998*. Lighting will need to comply with Australian Standards and requirements of BAC, CASA and Airservices Australia. It will need to be ensured that lighting of the development will meet the appropriate standards including Part 139 of the *Manual of Standards – Aerodromes* "lighting within the vicinity of aerodromes". Approval would need to be sought from the Secretary of the DIRD in the event that the intensity of the lighting chosen for the Project exceeds the levels outlined in the regulations, which would be considered blinding or confusing to pilots who are operating aircraft in the prescribed airspace.

The BAC Master Plan identifies zones that represent the "maximum intensity of lights sources measured at 3° above the horizontal". The eastern portion of the Project site is located in Zone B, Zone C and Zone D for the future parallel runway, which becomes operational in 2020 (refer Figure 13.4).

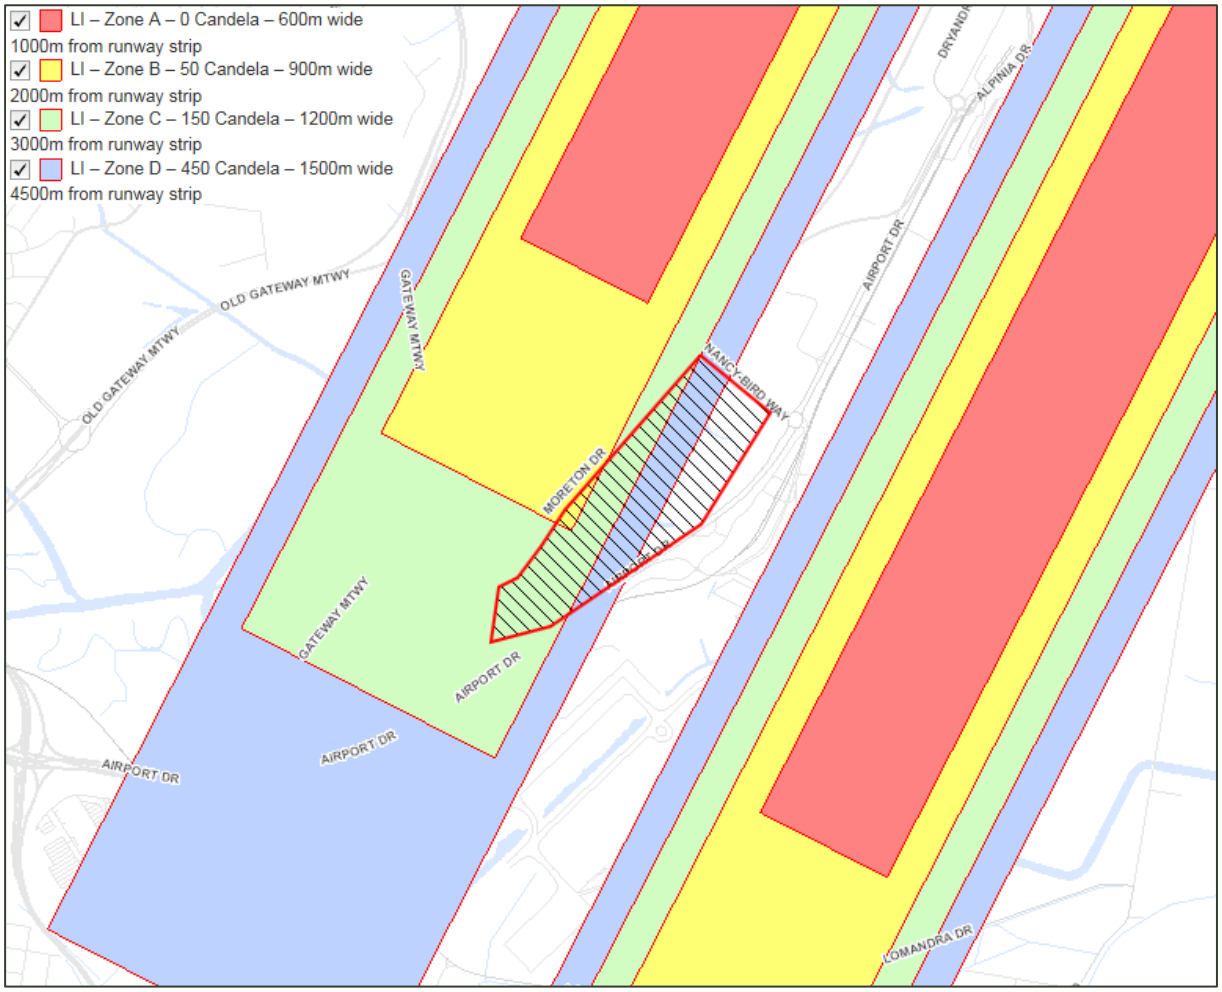

Figure 13.4 Lighting intensity overlay covering the Project site (hatched area)

Source: BCC 2014

13.4.3.3 Project-related dust generation

The generation of dust or other particulate matter is considered to be a controlled activity within the prescribed airspace. Dust generation is considered in further detail in Section 8.

Dust will be managed through the construction phase by implementing measures detailed in Section 8.7. Dust deposition monitoring will also be undertaken to assist in ensuring that dust levels do not exceed the levels outlined in the EHP guidelines (2017e).

13.5 Potential impacts

13.5.1 Traffic management

The Phase 1 delivery of the Project is expected to occur across a three stage construction program, with the site to be suitably prepared from 2021. This timeframe provides a preliminary construction program across approximately six years, although the bulk of the traffic movements are likely to occur in the initial 18 months with additional traffic movements upon completion of surcharging.

The Project may adopt a 24 hour earthwork operation as well as material processing, including sorting, crushing, processing and stockpiling. Site access may be obtained from Airport Drive (for Stages 1, 2 and 3), initially with a left in/left out arrangement, and also from Nancy Bird Way (for Stages 1 and 3). Access from Moreton Drive (left turn only) may also be required as an option. Site access arrangements will be confirmed during detailed design.

The Engineering Concept Design (Opus 2016) and proposed program of works (refer Appendix A) indicate that the likely excavation and fill volumes shall be in the order of:

Table 13.2 Preliminary bulk earthwork requirements for the Project

Stages	Duration of earthwork operation	Excavation volumes (m^3)	Fill volumes (m^3)
1 and 2	Stage 1: 15 months Stage 2: 3 months	67,000 27,600 (Stage 2 only)	General: 380,000 Drainage layer: 8,400 Surcharge: 336,000
3	6 months	7,200	Removal of excess surcharge: 200,000

The likely construction traffic during this period has been based on the following assumptions:

- The importation/removal of approximately 819,000 m^3 of associated earthworks in the initial 18 months of the Project and, in the final six months, removal of 7,200 m^3 of fill material and removal of approximately 200,000 m^3 of excess surcharge
- A truck and dog haul vehicle with a maximum capacity of 16 m^3 operating for 352 days per year (7 day working weeks minus all Queensland public holidays)
- Number of return trips per day:
  - For Stages 1 and 2: ((819,400 m^3 / 16 m^3) / (1.5 years x 352 days) = approximately 97 return trips per day
  - For removal of excess surcharge: ((207,200 m^3 / 16 m^3) / (0.5 years x 352 days) = approximately 74 return trips per day
- Accordingly, approximately **97 return trips** of construction traffic across a 12 hour working day for Stages 1 and 2 (initial 18 months only) and approximately **74 return trips** of construction traffic across a 12 hour working day for Stage 3 (removal of excess surcharge)
- Likely haulage routes include:
  - Stages 1 and 3: Airport Drive, Nancy Bird Way (with Moreton Drive as a potential option)
  - Stage 2: Airport Drive only
- Movement of fill material from the material processing areas to the remainder of the Project site will be done entirely within the Project site itself

During the earthwork program of Stages 1 and 2, the expected construction traffic is anticipated to increase northbound traffic on Airport Drive (over a 12 hour period) by 2.62% and southbound traffic on Airport Drive (over a 12 hour period) by 2.57%. Given the 12 hour earthwork operation, the peak hourly volume of Airport Drive will be increased by less than 2.0% both northbound and southbound.

During the removal of surcharge from Stage 3, the expected construction traffic is anticipated to increase northbound traffic on Airport Drive (over a 12 hour period) by 2.0% and southbound traffic on Airport Drive (over a 12 hour period) by 1.96%. Given the 12 hour earthwork operation, the peak hourly volume of Airport Drive will be increased by less than 2.0% both northbound and southbound.

Internal movement of fill within the site is assumed to be entirely contained within the Project site. In addition, excess surcharge material is anticipated to be re-used for surcharging of Stage 3.

Vehicular access to the surrounding properties is not expected to be affected during construction. Access to the AIRPARK precinct and the Brisbane Airport Services Centre will continue to be accessed via Nancy Bird Way and access to the International Terminal will continue to be via Nancy Bird Way and Airport Drive. Access to the Kingsford Smith Memorial from Airport Drive will not be affected.

It should be noted that these initial inputs are assumptions only and have been provided for indicative impacts. Material sources are yet to be finalised, and as a consequence, alternative haulage routes may also be need to be considered. In addition, the construction time frame and construction schedule may change, which may result in changes to any impacts.

13.5.2 Aviation safety

13.5.2.1 OLS and PANS-OPS surfaces

There are potential limits to heights of equipment and plant used within the Project site during construction beyond 2020 once the New Parallel Runway becomes operational. After 2020, construction plant and equipment (eg wick drain rigs) must be below 35 m in height when working in the south western portion and along the western boundary of the Project site. The BAC Master Plan (2014b) notes that in some instances, it may be necessary to ensure that an obstacle is marked and/or provided with night lighting to ensure it is visible to pilots.

However, the wick drain rigs are expected to undertake works in 2017 and 2018 and as such, there will be no height restrictions in place.

13.5.2.2 Project lighting

The Project site is approximately 1.0 km from the main runway and outside the lighting zones for the main runway. However, the eastern portion of the Project site is located within Zone B, Zone C and Zone D for the future parallel runway, which is expected to be operational by 2020. Given a 24 hour working day is an option and night-time construction works are required (eg rock crushing activities), consideration will need to be given to appropriate night lighting, in accordance with CASA's *Manual of Standards Part 139 – Aerodromes (Lighting in the Vicinity of Aerodromes)*.

13.5.2.3 Project-related dust generation

While the prescribed airspace for the current and future runways could potentially be impacted if no mitigation were put in place, it is considered that the Project dust management measures will be adequate to manage dust and minimise any impacts to visibility in the prescribed airspace. In addition, a rattle-grid may be installed at the access/egress point to the Project site. Dust deposition monitoring (baseline and construction) will also be undertaken for the Project to determine whether the baseline conditions and construction conditions will be within acceptable levels listed in the EHP guidelines (2017e). If baseline and construction conditions are maintained within acceptable levels, approval to emit dust will not be required.

13.6 Mitigation measures

Table 13.3 provides a summary of the mitigations recommended to be adopted during the construction of the Project.

Table 13.3 Traffic and aviation safety mitigation measures

Potential environmental aspect/impact	Management objective	Action	Phase to be implemented	Outcome
Traffic				
Construction traffic is likely to have negligible impact on the operational performance of the local road network	Maintain operational performance of: ■ Nancy Bird Way/ Moreton Drive roundabout ■ Nancy Bird Way/ Airport Drive roundabout	■ Preferred construction haulage routes and traffic management requirements to be determined in consultation with construction contractor ■ Traffic Management Plan to be developed by the construction contractor and to be approved by BAC prior to commencing works ■ Road Condition Assessment Report to be developed by the construction contractor for the proposed haul routes within Brisbane Airport. Beyond Brisbane Airport, the construction contractor must ensure haul routes are appropriate and that haulage routes and traffic movements comply with local and State legislation	Prior to construction	BAC to determine preferred haulage routes Requirements to be included in the EMP
Aviation safety				
Lighting used within the Project site may impact on pilot's visibility	Manage the use of lighting within the Project site	■ Chapter 9 of the CASA *Manual of Standards Part 139 – Aerodromes (Lighting in the Vicinity of Aerodromes)* provides guidance on lighting at airports. This will need to be considered if BAC and the Contractor choose to undertake construction works at night-time. ■ If plant/equipment is tall in height, it may be necessary to attach a marker or light to the top of the equipment to ensure pilot visibility of the plant/equipment. This would need to be done in accordance with the marking and lighting requirements outlined in CASA's *Manual of Standards Part 139 – Aerodromes*.	Construction	Requirements to be included in the EMP
Dust generated during construction of the Project may impact on visibility within the prescribed airspace	Monitor dust levels and adopt dust management measures during construction	■ Undertake baseline and construction dust monitoring (as detailed in Section 8) ■ Implement mitigation measures to manage dust during construction (as detailed in Section 8.7)	Pre-construction and construction	Requirements to be included in the EMP

Potential environmental aspect/impact	Management objective	Action	Phase to be implemented	Outcome
Heights of construction equipment and plant restricted by the OLS and PANS-OPS surfaces in 2020 and beyond	Ensure heights of equipment and plant used within the Project site are appropriate	■ Based on the height limitations within the Project site from 2020 and beyond, equipment and plant is to be selected to ensure it does not exceed the OLS and PANS-OPS surfaces. If plant and equipment intrudes into the OLS and PANS-OPS surfaces in 2020 and beyond (ie OLS of greater than 35 m and PANS-OPS of 50 to 98 m AHD for the north eastern portion, and PANS-OPS of 3.9 to 98 m AHD for the south western portion), an approval will need to be sought from the Secretary of the DIRD under the Airports Act. ■ BAC will need to submit details of obstacles close to or intruding into the OLS and/or PANS-OPS to CASA for hazard assessment and particular requirements for marking and lighting as per CASA's *Manual of Standards Part 139 - Aerodromes*.	Construction	Requirements to be included in the EMP

14 Landscape and visual amenity

14.1 Introduction

This section provides a summary of the landscape and visual amenity issues that will need to be considered during construction.

A range of mitigation measures are also recommended to be implemented during construction.

14.2 Methodology

A review of the relevant legislation, policies and guidelines relevant to landscape and visual amenity for the Project has been undertaken. A review of the existing landscape and visual amenity across the Project site is provided.

The existing environment conditions have indicated the potential impacts that may occur during the construction and operation of the Project.

14.3 Existing environment

The existing landscape of the Project site is a combination of casuarina plantations, interspersed by weeds (ie Lantana), mangroves along the existing drains and a grassed area in the south west portion of the Project site. The CPA is located north west of the Project site and the Brisbane Airport Services Centre is located directly north of the Project site. The International Terminal, parking and Airtrain station are located east of the Project site. Kedron Brook Floodway Drain and the new parallel runway (under construction) are located further north of the Project site.

14.4 Potential impacts

The Project will result in some impacts to visual amenity during construction, but this is likely to only impact those tenancies directly adjacent to the Project site and vehicles on Moreton Drive, Airport Drive and Nancy Bird Way. The anticipated visual impact may relate to potential dust issues, plus direct views towards the construction area, including construction plant and equipment. These impacts would be temporary and limited to the construction phase only.

14.5 Mitigation measures

Table 14.1 provides a summary of the mitigation measures to be adopted during construction of the Project.

Table 14.1 Landscape and visual amenity potential impacts and mitigation measures

Potential environmental aspect/ impact	Management objective	Action	Phase to be implemented	Outcome
Impacts on visual amenity due to dust generated by construction activities	Ensure that impacts to visual amenity to surrounding businesses/ residents is minimised	■ Implement WSUD measures (as recommended in Section 7) that complement the intents of the BAC Master Plan (2014b) ■ Implement mitigation measures as recommended in Section 8.7 in relation to air quality	Construction	To be included in the EMP

15 Conclusions and recommendations

Aurecon has prepared this EAR for the proposed Brisbane Airport Auto Mall Project, which includes design and construction of bulk earthworks to develop the land for a future proposed Auto Mall development consisting of roads, services and the test track.

If recommended mitigation and management measures are implemented, the Project clearing and earthworks will not have a significant environmental or ecological impact and will not trigger the requirements for preparing a MDP under Section 89 of the Airports Act. If mitigation measures identified in this EAR are adopted and implemented, the Project is not considered development of a kind that:

- *is likely to have significant environmental or ecological impact*
- *affects the Kingsford Smith Memorial immediately adjacent to the Project site*
- *likely to have a significant impact on the local or regional community*

The Project is considered to be consistent with the “Mixed Use” zoning for the Project site under the 2014 Master Plan (BAC 2014b).

A summary of the key actions are:

- A CEMP needs to be prepared for the Project. The Contractor shall be monitored by the BAC Environmental Advisor to determine Contractor compliance with the CEMP.
- An ESCP is to be prepared by a suitably qualified and experienced professional in accordance with the requirements of the IECA Guidelines (2008) (eg a CPESC or an RPEQ with at least two years’ experience in the management of E&SC that can be verified by an independent third party)
- A pre-clearing habitat assessment is to be conducted by a licenced and suitably qualified spotter catcher prior to construction works commencing. The spotter catcher shall remain on call during all vegetation clearing activities.
- All vehicles leaving the site will exit via the following sediment control measures:
  - Primary treatment across rock surfaced roadways of nominally 120 m for trucks and plant and a minimum 50 m for light vehicles
  - All vehicles will traverse a minimum of three rumble/ shaker grids (approximately 7.5 m in length). All vehicles will then traverse over a two part (7 m plus 13 m) mass concrete driveway separated by rock
  - As a final tertiary measure, all vehicles will travel north on Airport Drive on an existing asphalt pavement (one lane of Airport Drive, which form part of the Project site) for a minimum of 340 m allowing "within site" control of sediment
- Compliance with the requirements of the ASS Management Plan
- Should potential contaminated materials (black sands) be observed during excavation within the CSR Site 28 area, material is to be stockpiled and the BAC Environmental Advisor is to be consulted for approval of investigation and management measures (in consultation with the AEO)
- Comply with the ACM Management Plan developed for the Project in the event that ACM is encountered on site

- Future permanent flap/tidal gates may be installed at the major culverts under Moreton Drive and Nancy Bird Way to prevent backwater from tidal events, storm surges and regional flood events entering the Project site. A perimeter drain will be installed around the boundary of the Project site with catch drains to capture any sediment-laden runoff from disturbed land, bunded from external discharge during the Project land development bulk earthworks.
- Groundwater monitoring will be undertaken during filling and until excess surcharge material is removed, within the monitoring wells indicated in Figure 7.1. Groundwater will be monitored for PFAS (ultra-trace) and dissolved metals/metalloids (aluminium, arsenic, cadmium, chromium, copper, iron, lead, mercury, nickel, zinc and titanium (if required)):
  - Monthly during placement of fill and surcharge activities for a period of six months or until results of monitoring have stabilised over a three month period (and provided the performance limits have been met, and continue to be met)
  - Once every six months for the remainder of fill placement and surcharge activities (provided the performance limits continue to be met)
  - Once every six months for removal of surcharge and completion of earthworks (provided the performance limits remain to be met)
- Groundwater shall be monitored for ASS within the monitoring wells indicated in Figure 7.1:
  - For one round of baseline data upon installation of any new groundwater wells
  - Monthly during placement of fill and surcharge earthworks for field measurements and every two months for laboratory analysis
  - Monthly during filling and surcharging activities for field measurements for the initial two months and monthly until groundwater level has stabilised, and every two months for laboratory analysis for at least six months and until results of monitoring stabilise over a four month period
- Samples collected during groundwater monitoring for ASS should be analysed for:
  - Field measurements: water level, pH, electrical conductivity, redox potential, total alkalinity
  - Laboratory analysis: pH, electrical conductivity, total titratable acidity, total alkalinity, dissolved iron and aluminium, dissolved ions (chloride and sulphate)
- Undertake baseline and construction air quality monitoring (dust deposition gauge) at key locations surrounding the Project site (refer Figure 7.1) to assist in proactively managing air quality issues to ensure community expectations and environmental requirements are met
- Undertake background noise monitoring at the Kingsford Smith Memorial and Brisbane Airport Services Centre at least two weeks prior to the commencement of construction. Noise monitoring at sensitive receptors during construction will be undertaken in the event of a substantiated noise complaint.
- Undertake background vibration monitoring inside or immediately outside the Kingsford Smith Memorial (on the north west side) at least two weeks prior to the commencement of construction. During vibration inducing works within 200 m of the Kingsford Smith Memorial, and if a validated complaint regarding vibration is received, vibration monitoring shall be undertaken inside or immediately outside the Kingsford Smith Memorial (on the north west side) to ensure that vibration levels are kept below 5 mm/s in consultation with the BAC Environmental Advisor.
- Prior to the commencement of Project works, conduct a building assessment on the Kingsford Smith Memorial and repair/replace all door seals and building joints as required
- Contractor to comply with lighting requirements recommended in Part 139 of the *Manual of Standards – Aerodromes: Section 9*. For example, lights shall be installed and screened in such a way that no light is directly transmitted above a horizontal plane through the light source.
- Undertaking consultation with neighbouring stakeholders about the Project generally, in accordance with Section 10.6 of this EAR

It is essential that the Project adopts mitigation measures as recommended to ensure all environmental obligations under the relevant legislation will be complied with. If these recommended mitigation measures are adopted, it is considered that BAC can conduct Project works in a manner

that will satisfy relevant statutory goals and criteria to allow BAC to comply with their obligations under relevant legislation.

Accordingly, this EAR concludes that the Project will have minimal impact on the environment and heritage matters if recommended mitigation and management measures are implemented.

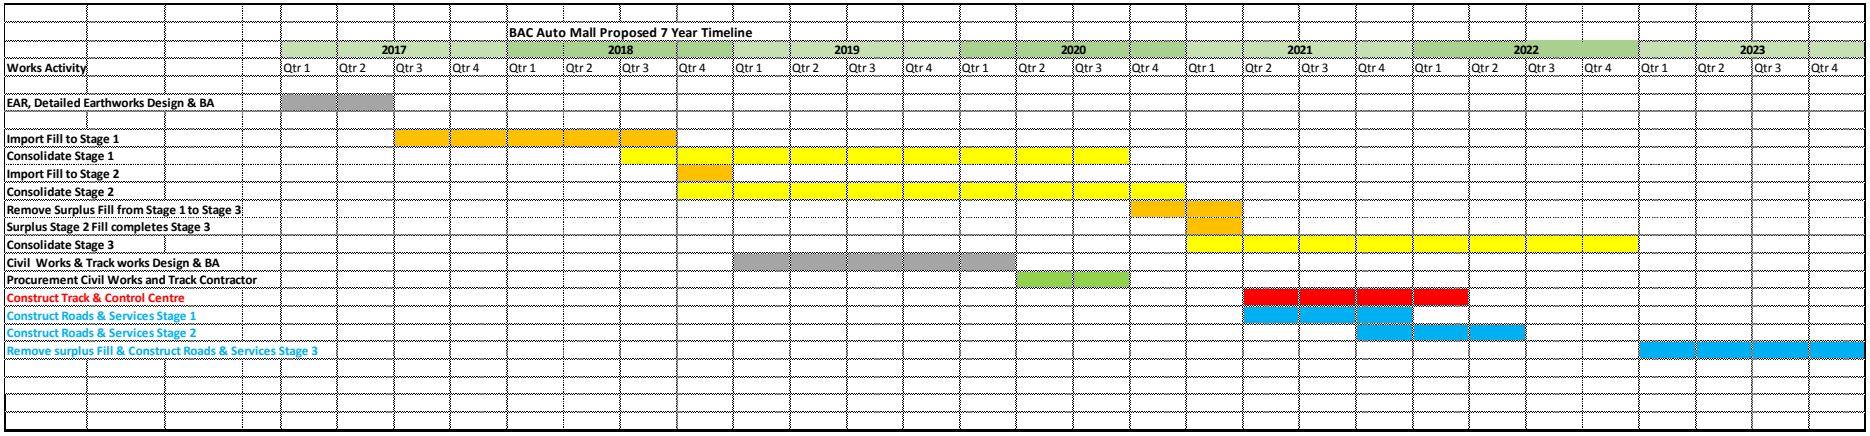
Appendices

Appendix A
Proposed program

Auto Mall Development Proposed Program



Appendix B
Project compliance tables

Table 1 Development control guidelines relevant to the Project

Performance criteria	Controls	Comments
P1. Development is to be designed and located to achieve an acceptable level of flood immunity	C1.1 Advice on a site Minimum Development Level (MDL) should be sought from BAC before an application is lodged. Further consideration for building floor level is to include a variable height to address ground settlement. Contact the Airport Approvals Manager for further details.	To achieve 1:100 year flood immunity, the surrounding roads need to be raised by up to 500 mm. These road systems combined with flap gates installed on a number of major culvert crossings will prevent backwater from regional flood events and storm surge/tidal events entering the Project site. Refer Section 3.5 of the EAR for further details.
P13. Utility placement is integrated into site planning	C13.1 Utility placement is to be provided for the proposed development site and constructed to relevant standards and in accordance with BAC's Engineering Technical Guidelines. C13.2 A comprehensive communications network has been installed throughout the Airport Precincts. Refer to the Airport Approvals Manager for advice on connecting to telecommunication service providers.	The designer will be responsible for ensuring that utilities are placed appropriately on the Project site.
P15. Site planning should prevent the impacts upon underground services	C15.1 Ensure the site layout avoids, where possible, building over any underground services. C15.2 Where the development is proposed to be built over existing utilities, approval will be needed from BAC before the development application is lodged. C15.3 Refer to the ASCON (**As Con**structed) database for information on identifying easements, utilities and existing features. A copy of the ASCON database can be made available on request. BAC has developed a set of standards for the installation of utilities. Figure 6 (in the DCD) provides the preferred layout for roads and services reserves, including space for streetlights, stormwater, footpath, recycled water, sewer, water and power.	There are a number of existing underground services within the Project site, including the Energex high voltage cable (refer Section 4.4.3). There is the potential for the Project to impact on these services, which will need to be managed through detailed design.
P27. Traffic access should be designed to create a safe and functional environment	C27.1 Access to the site satisfies the following: (a) Provide for safe entering sight distance requirements in accordance with AUSTROAD Standards (b) Provide for pedestrian and cyclist requirements, where required (c) Be clear from bus stops, taxi ranks, traffic control devices and significant trees. C27.2 Any vehicle loading and servicing waste removal bays are located to be concealed and screened from view, from a public area. C27.3 Driveways are to be located as far as possible from intersections as follows in Table 4. **Table 4 Minimum separation for driveways**	The designer will be responsible for ensuring adherence to these access requirements. A Traffic Management Plan will be required to be developed by the Construction Contractor.

<table>
<tr><th>Performance criteria</th><th>Controls</th><th>Comments</th></tr>
<tr><td></td><td>
<table>
<tr><th>Type of frontage road</th><th>Adjacent feature</th><th>Minimum separation of driveway from adjacent feature</th></tr>
<tr><td rowspan="4">Local access</td><td>Local access intersection</td><td>20 m from intersection</td></tr>
<tr><td>Suburban road intersection</td><td>20 m from intersection</td></tr>
<tr><td>Median break</td><td>20 m from median nose</td></tr>
<tr><td>Traffic signals</td><td>Clear of queue areas and turning lanes</td></tr>
<tr><td rowspan="4">Suburban</td><td>Local access intersection</td><td>30 m from intersection</td></tr>
<tr><td>Suburban road intersection</td><td>60 m from intersection</td></tr>
<tr><td>Median break</td><td>30 m from median nose</td></tr>
<tr><td>Traffic signals</td><td>Clear of queue areas and turning lanes</td></tr>
</table>
(Source: adapted from Transport, Access, Parking and Servicing Planning Scheme Policy, Brisbane City Council, Brisbane City Plan 2000).

C27.4 Direct frontage access will not be permitted off Moreton Drive and limited on other roads.

C27.5 Refer to Attachment A for road cross sections at specific locations across airport.

C27.6 All driveways are to be located and constructed so as to provide sight distances not less than those shown in Table 5 below. The driveways are measured from a point 5 m outside the edge of the through carriageway as shown in Figure 7 (of the DCD). Driveway to be designed as a standard crossover in accordance with relevant AUSTROADS standards.

Table 5 Minimum sight distances
<table>
<tr><th>Speed environment (kph)</th><th>Sight distance (m)</th></tr>
<tr><td>50</td><td>90</td></tr>
<tr><td>60</td><td>110</td></tr>
<tr><td>70</td><td>130</td></tr>
<tr><td>80</td><td>150</td></tr>
</table>
(Source: adapted from Roads Planning and Design Manual, Chapter 13, October 2006, Department of Transport and Main Roads).

C27.6 A Traffic Management Plan (TMP) is required for construction works that will affect the BAC road network and is lodged with BAC prior to the request for work permit (note: Permit to Work Corporate Standard and Permit Form is available at Brisbane Airport’s website). A TMP is to be prepared in accordance with the Manual of Uniform Traffic Control Devices (MUTCD) Part 3 (DTMR, Fourth Issue, 30 April 2010).
</td><td></td></tr>
</table>

Performance criteria	Controls	Comments
P39. The storage of hazardous or flammable materials is not to endanger the site, building, neighbouring tenants or people.	C39.1 Any development storing hazardous or flammable materials should undertake a hazard, identification and risk analysis and prepare a safety/hazard management plan. C39.2 All storage areas are to be secured and signed appropriately and in accordance with relevant Australian Standards.	The storage of hazardous and flammable materials shall be managed in accordance with applicable Australian Standards during construction of the Project.
P40. Ensure the quality of water is managed and reasonable and practicable measures undertaken to prohibit pollution and/or contamination (both solid and liquid) from directly or indirectly entering the storm water system.	C40.1 Stormwater drainage from the site is of an acceptable quality and volume to prevent harmful impacts on receiving waters. All stormwater leaving the site is to achieve the following minimum reductions in total pollutant load, compared to untreated stormwater runoff: ■ 80% reduction in Total Suspended Solids ■ 60% reduction in Total Phosphorus ■ 45% reduction in Total Nitrogen ■ 90% reduction in Gross Pollutants/litter ■ Hydrocarbons – visible sheen or odour. (Source: WSUD Technical Design Guidelines for South East Queensland). C40.2 Stormwater discharge points are to be located so that they do not adversely impact on areas of ecological value, or cause nuisance or damage to adjoining properties C40.3 Water Sensitive Urban Design (WSUD) principles should be achieved on site. Stormwater and other site runoff are to be appropriately treated and managed on site by use of devices, such as pollutant traps, settling ponds, retention basins and swales. C40.4 A Site-Based Stormwater Management Plan should be prepared and provide for: ■ An acceptable level of flood immunity ■ Public safety and risk management measures ■ Erosion and sediment control ■ WSUD alternatives in parallel with site landscaping. For guidance on preparing a Site-Based Stormwater Management Plan refer to the Airport Approvals Manager. C40.5 Refer to the 2009 Landscape Master Plan for acceptable WSUD species on-airport and the SEQ Healthy Waterways 2006, Water Sensitive Urban Design, Technical Design Guidelines for South East Queensland. C40.6 The Airport Approvals Manager may require arrangements to be made between the proponent and an adjoining lessee to facilitate appropriate stormwater management arrangements.	Stormwater leaving the site during construction of the Project will need to be managed in accordance with applicable guidelines and managed through the adoption of management measures recommended in this EAR. The designer will be responsible for ensuring that future development on the Project site adopts WSUD principles.

Performance criteria	Controls	Comments
P41. Building height or structure is not to intrude into the Obstacle Limitation Surface (OLS) or result in sight line obstruction to the Runway and Taxiway system.	C41.1 Building and structures, including any appurtenances (aerials, spires etc.), should not encroach the prescribed airspace. The aim of the OLS is to ensure the safe operation of aircraft. If a building height is more than 15 metres above ground, advice should be sought from the Airport Approvals Manager before an application is lodged. Buildings higher than 15 metres may require further assessment depending on the location and prescribed airspace at the location. Separate approval will be required for all cranage operations. C41.2 Building height in the vicinity of the Control Tower must maintain air traffic control sightlines to the runway, taxiway and apron areas. Please contact the Airport Approvals Manager during the design phase to confirm requirements for sight line assessments.	Section 13 of the EAR provides an assessment of the potential impacts to the OLS. If plant and equipment intrudes into the OLS and PANS-OPS surfaces, an approval will need to be sought from the Secretary of DIRD under the Airports Act.
P42. Developments should not constitute a safety hazard to aviation operations.	C42.1 Mitigation of emissions from dust, smoke, liquid and gas vapour or particulate matters that may adversely affect airport's operational airspace must be addressed. This includes gas/discharge plumes from industry with a velocity exceeding 4.3 m/sec (at the point of emission) or likely to cause visibility problems, may be classified as a 'controlled activity'. Development should not create an artificial light source (eg laser lights) or reflect sunlight. C42.2 If cranes are to be used for construction, under the *Airports (Protection of Airspace) Regulations*, approval will need to be sought from the Airport Approvals Manager.	Mitigation measures outlined in this EAR (refer Section 8) will be adopted during construction to manage air quality impacts. An assessment of the potential impacts of lighting and height of structures (eg cranes, wick drain rigs) during construction of the Project has been undertaken in Section 13. The Contractor will need to ensure that any approvals are obtained prior to the commencement of construction.
P43. Lighting of the development and streetscape is not to impact on the operation of the airport.	C43.1 Lighting is to comply with the Civil Aviation Safety Authority (CASA) Manual of Standards – Part 139, Section 9.21 – Lighting in the Vicinity of Aerodromes.	An assessment of the potential impacts of lighting and recommended mitigation measures for the Project is provided in Section 13.

Table 2 Compliance of the Project with the Airport Technical Guidelines

Section of Airport Technical Guidelines	Requirements	Project compliance
3.1 Environmental Requirements	There are specific requirements in relation to environmental management on Brisbane Airport related to: (a) Regulations and Legislation (b) Construction Environmental Management Plans (CEMP) (c) Review and Approval Process	This EAR demonstrates the Project's compliance with the relevant regulations and legislation. A CEMP will need to be prepared for the Project prior to construction, addressing the recommended measures outlined in this EAR.
3.1.1 Acid sulfate soils (ASS)	A detailed ASS investigation is required if the Project is anticipated to excavate more than 100 m^3 of soil, or imports more than 500 m^3 of soil.	An ASS investigation has been conducted with details provided in Section 6 of this EAR.
3.1.2 Red Imported Fire Ants (RIFA)	Adoption of management controls for high risk activities (eg earthmoving activities, rotating stockpiles) must be implemented to help prevent the spread of fire ants.	The Project site is located within Fire ant biosecurity zone 3. As such, there are restrictions on the movements of fire ant carriers (eg soil, mulch, turf, potted plants etc).
3.1.3 Contaminated sites	Prior to the commencement of any design works, the BAC Project Manager is to be consulted with regards to the Contaminated Sites Register. Any development on contaminated land must be designed accordingly.	A contaminated land investigation has been conducted with details provided in Section 6 of the EAR.
3.1.4 Erosion and sediment control	Where the project involves the disturbance of soils, an Erosion and Sediment Control Plan (ESCP) must be developed in accordance with the Best Practice Erosion and Sediment Control manual (IECA 2008).	The Project will require the development of an ESCP by a Certified Erosion and Sediment Control Professional. This is discussed in further detail in Sections 5 and 7 of the EAR.
3.1.5 Water quality monitoring	Details of a surface and groundwater monitoring program (where applicable) are to be discussed with BAC during the project design phase. Provisions are also to be made with regards to dewatering activities specifically excavations and sediment basin operation. Water quality is to comply with the AEPR.	The Project will require surface and groundwater monitoring to be undertaken (refer Section 7 of the EAR for further detail).
3.2 Site geology	There is the potential for differential settlement to occur given the nature of the airport's reclaimed ground.	A geotechnical investigation has been conducted (refer Section 5). The Designer will need to consider the effects that settlement will have on the development of the Project (eg consider proposed use and loadings on the site).
3.3 Preparation of documentation	All design documentation must be prepared in accordance with BAC's Specification for Drafting and As-built Project Documentation.	This will be the responsibility of the Designer to ensure that all design and as-constructed information is submitted in the appropriate form for BAC's approval.
3.4 Survey and set-out	Brisbane Airport utilises a site specific Aerodrome Datum as the basis for all survey control.	The Designer will need to consider this when undertaking the detailed design of the Project site.
3.5 As-Built and As-Constructed project documentation	All projects must submit all As-Built and As-Constructed information in order to obtain a Completion Certificate from the Airport Building Controller.	This EAR does not involve the development of as-built and as-constructed information. Therefore, this requirement is not applicable until the design phase.

Section of Airport Technical Guidelines	Requirements	Project compliance
3.6 Height Restrictions	Legislation controls the height of structures (temporary or permanent) on and around Brisbane Airport.	Discussion regarding height of temporary structures used during construction of the Project is provided in Section 13 of this EAR.
3.8 Protection of Services	At any point at which a construction road, or construction traffic, crosses the line of an existing underground service, protection to the service from damage shall be provided.	A number of services have been identified within/adjacent to the project area (refer Section 4). It will be the responsibility of the Designer to ensure that impacts to services are mitigated and managed appropriately.
3.9 Temporary construction services	All temporary electrical services, water, sewer and recycled water must be installed and paid by the Contractor.	This will be the responsibility of the Contractor during construction of the Project.
3.10 Traffic management	All works shall facilitate the safe and orderly passage of vehicular and pedestrian traffic through and around the site at all times from the commencement of work on the site to the completion of works.	Traffic management is discussed in Section 13 of this EAR.
3.12 Lighting of night work	Details of the proposed temporary lighting of works are to be submitted to BAC for approval. The Contractor is responsible for ensuring that the requirements as stipulated in Section 9 of the CASA Manual of Standards Part 139 are adhered to at all times during the works.	Details regarding temporary lighting are provided in Section 13.
4. Safety in design	Designers are to undertake all practicable measures to minimise the risk to safety during the design phase. For example, all designers and contractors working on airport projects are to undertake, as part of the design process, a Safety in Design assessment.	The Designer will be responsible for ensuring that the Project is compliant with the applicable safety standards.
5. Sustainability in design and construction	All designers and contractors working on airport projects are to undertake, as part of the design process, a Design Sustainability Statement.	The Designer will be responsible for adopting sustainability elements as part of the Project's design. A range of measures are suggested in the Airport Technical Guidelines.

Note:
This map shows the location of wetland protection areas which are defined under the Environmental Protection Regulation 2008. Within wetland protection areas, certain types of development involving high impact earthworks are made assessable under Schedule 3 of the Sustainable Planning Regulation 2009.

The Department of State Development Infrastructure and Planning is the State Assessment Referral Agency (SARA) under Schedule 7 of the Sustainable Planning Regulation 2009 for assessable development involving high impact earthworks within wetland protection areas. The Department of Environment and Heritage Protection is a technical agency.

The policy outcome and assessment criteria for assessing these applications are described in the State Development Assessment Provisions (SDAP) *Module 11: Wetlands and wild rivers.*

This map is produced at a scale relevant to the size of the lot on plan identified and should be printed at A4 size in portrait orientation. Consideration of the effects of mapped scale is necessary when interpreting data at a large scale.

For further information or assistance with interpretation of this product, please contact the Department of Environment and Heritage Protection at www.ehp.qld.gov.au or email planning.support@ehp.qld.gov.au.

Note:
This map shows the location of wetlands on the Map of Referable Wetlands which are defined under the Environmental Protection Regulation 2008.

Wetlands are assessed for ecological significance using the environmental values for wetlands in section 81A of the Environmental Protection Regulation 2008. Wetlands are considered either High Ecological Significance (HES) or of General Ecological Significance (GES) for the purposes of the environmental values.

This map is produced at a scale relevant to the size of the lot on plan identified and should be printed at A4 size in portrait orientation. Consideration of the effects of mapped scale is necessary when interpreting data at a large scale.

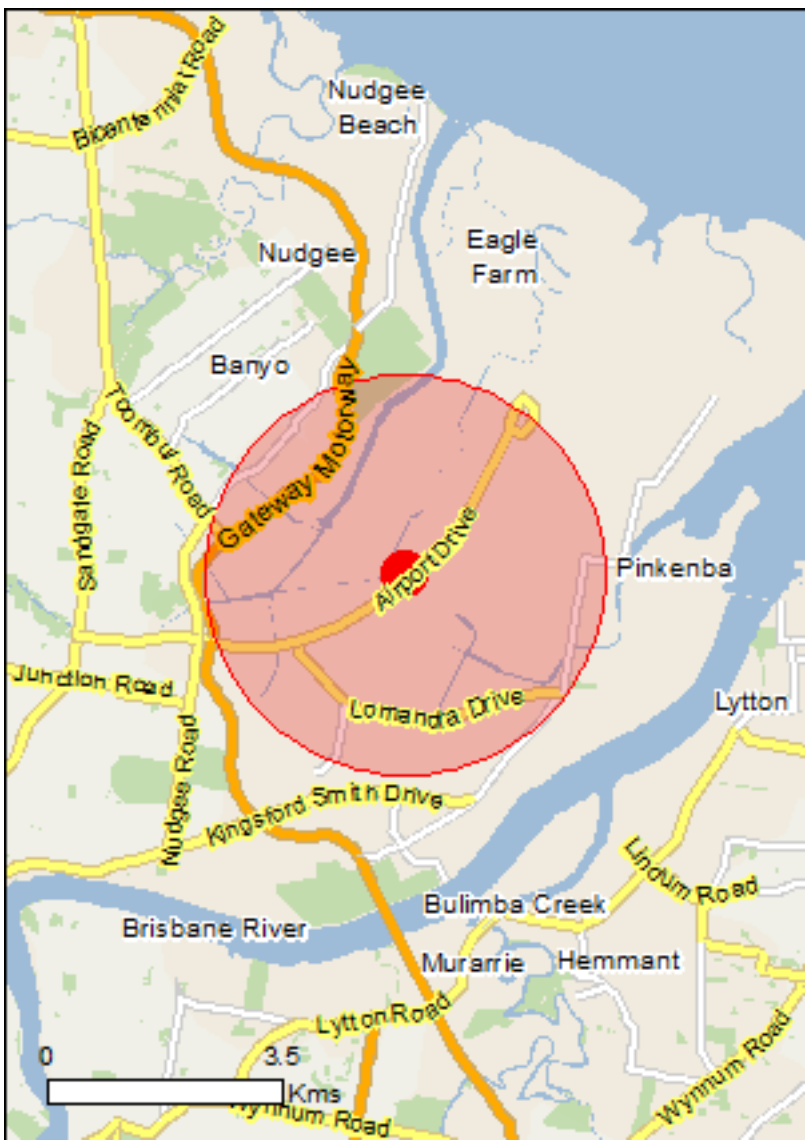
EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected.

Information on the coverage of this report and qualifications on data supporting this report are contained in the caveat at the end of the report.

Information is available about Environment Assessments and the EPBC Act including significance guidelines, forms and application process details.

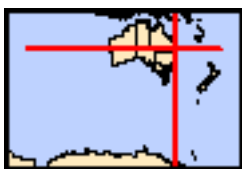
Report created: 01/03/17 15:36:18



This map may contain data which are ©Commonwealth of Australia (Geoscience Australia), ©PSMA 2010

Coordinates

Buffer: 3.0Km



Summary

Matters of National Environmental Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance:	1
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	None
Listed Threatened Ecological Communities:	2
Listed Threatened Species:	32
Listed Migratory Species:	14

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at http://www.environment.gov.au/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Land:	1
Commonwealth Heritage Places:	None
Listed Marine Species:	22
Whales and Other Cetaceans:	None
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Commonwealth Reserves Marine:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have nominated.

State and Territory Reserves:	None
Regional Forest Agreements:	None
Invasive Species:	43
Nationally Important Wetlands:	None
Key Ecological Features (Marine)	None

Details

Matters of National Environmental Significance

Wetlands of International Importance (Ramsar) [Resource Information]

Name	Proximity
Moreton bay	Within 10km of Ramsar

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Name	Status	Type of Presence
Lowland Rainforest of Subtropical Australia	Critically Endangered	Community may occur within area
Subtropical and Temperate Coastal Saltmarsh	Vulnerable	Community likely to occur within area

Listed Threatened Species [Resource Information]

Name	Status	Type of Presence
Birds		
Anthochaera phrygia Regent Honeyeater [82338]	Critically Endangered	Foraging, feeding or related behaviour likely to occur within area
Botaurus poiciloptilus Australasian Bittern [1001]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Dasyornis brachypterus Eastern Bristlebird [533]	Endangered	Species or species habitat likely to occur within area
Erythrotriorchis radiatus Red Goshawk [942]	Vulnerable	Species or species habitat likely to occur within area
Geophaps scripta scripta Squatter Pigeon (southern) [64440]	Vulnerable	Species or species habitat may occur within area
Lathamus discolor Swift Parrot [744]	Critically Endangered	Species or species habitat may occur within area
Limosa lapponica baueri Bar-tailed Godwit (baueri), Western Alaskan Bar-tailed Godwit [86380]	Vulnerable	Species or species habitat known to occur within area
Limosa lapponica menzbieri Northern Siberian Bar-tailed Godwit, Bar-tailed Godwit (menzbieri) [86432]	Critically Endangered	Species or species habitat may occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species

Name	Status	Type of Presence
		habitat known to occur within area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat likely to occur within area
Poephila cincta cincta Southern Black-throated Finch [64447]	Endangered	Species or species habitat may occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
Turnix melanogaster Black-breasted Button-quail [923]	Vulnerable	Species or species habitat may occur within area
Mammals		
Chalinolobus dwyeri Large-eared Pied Bat, Large Pied Bat [183]	Vulnerable	Species or species habitat may occur within area
Dasyurus hallucatus Northern Quoll, Digul [331]	Endangered	Species or species habitat may occur within area
Dasyurus maculatus maculatus (SE mainland population) Spot-tailed Quoll, Spotted-tail Quoll, Tiger Quoll (southeastern mainland population) [75184]	Endangered	Species or species habitat may occur within area
Petauroides volans Greater Glider [254]	Vulnerable	Species or species habitat may occur within area
Phascolarctos cinereus (combined populations of Qld, NSW and the ACT) Koala (combined populations of Queensland, New South Wales and the Australian Capital Territory) [85104]	Vulnerable	Species or species habitat known to occur within area
Pteropus poliocephalus Grey-headed Flying-fox [186]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Xeromys myoides Water Mouse, False Water Rat, Yirrkoo [66]	Vulnerable	Species or species habitat likely to occur within area
Plants		
Arthraxon hispidus Hairy-joint Grass [9338]	Vulnerable	Species or species habitat may occur within area
Bosistoa transversa Three-leaved Bosistoa, Yellow Satinheart [16091]	Vulnerable	Species or species habitat likely to occur within area
Cryptocarya foetida Stinking Cryptocarya, Stinking Laurel [11976]	Vulnerable	Species or species habitat may occur within area
Dichanthium setosum bluegrass [14159]	Vulnerable	Species or species habitat may occur within area
Macadamia integrifolia Macadamia Nut, Queensland Nut Tree, Smooth-shelled Macadamia, Bush Nut, Nut Oak [7326]	Vulnerable	Species or species habitat likely to occur within area
Macadamia tetraphylla Rough-shelled Bush Nut, Macadamia Nut, Rough-shelled Macadamia, Rough-leaved Queensland Nut [6581]	Vulnerable	Species or species habitat may occur within area

Name	Status	Type of Presence
[Phaius australis](#) Lesser Swamp-orchid [5872]	Endangered	Species or species habitat likely to occur within area
[Samadera bidwillii](#) Quassia [29708]	Vulnerable	Species or species habitat likely to occur within area
[Thesium australe](#) Austral Toadflax, Toadflax [15202]	Vulnerable	Species or species habitat may occur within area
Reptiles		
[Delma torquata](#) Adorned Delma, Collared Delma [1656]	Vulnerable	Species or species habitat may occur within area
[Saiphos reticulatus](#) Three-toed Snake-tooth Skink [88328]	Vulnerable	Species or species habitat may occur within area

Listed Migratory Species [Resource Information]

* Species is listed under a different scientific name on the EPBC Act - Threatened Species list.

Name	Threatened	Type of Presence
Migratory Marine Birds		
[Apus pacificus](#) Fork-tailed Swift [678]		Species or species habitat likely to occur within area
[Puffinus carneipes](#) Flesh-footed Shearwater, Fleshy-footed Shearwater [1043]		Species or species habitat likely to occur within area
Migratory Terrestrial Species		
[Cuculus optatus](#) Oriental Cuckoo, Horsfield's Cuckoo [86651]		Species or species habitat known to occur within area
[Hirundapus caudacutus](#) White-throated Needletail [682]		Species or species habitat known to occur within area
[Monarcha melanopsis](#) Black-faced Monarch [609]		Species or species habitat known to occur within area
[Monarcha trivirgatus](#) Spectacled Monarch [610]		Species or species habitat known to occur within area
[Myiagra cyanoleuca](#) Satin Flycatcher [612]		Species or species habitat known to occur within area
[Rhipidura rufifrons](#) Rufous Fantail [592]		Species or species habitat likely to occur within area
Migratory Wetlands Species		
[Calidris ferruginea](#) Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
[Gallinago hardwickii](#) Latham's Snipe, Japanese Snipe [863]		Species or species habitat may occur within area
[Limosa lapponica](#) Bar-tailed Godwit [844]		Species or species habitat known to occur within area

Name	Threatened	Type of Presence
Numenius madagascariensis		
Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Pandion haliaetus		
Osprey [952]		Species or species habitat known to occur within area
Tringa nebularia		
Common Greenshank, Greenshank [832]		Species or species habitat likely to occur within area

Other Matters Protected by the EPBC Act

Commonwealth Land [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Name
Defence - DAMASCUS BARRACKS - MEEANDAH

Listed Marine Species [Resource Information]

* Species is listed under a different scientific name on the EPBC Act - Threatened Species list.

Name	Threatened	Type of Presence
Birds		
Anseranas semipalmata		
Magpie Goose [978]		Species or species habitat may occur within area
Apus pacificus		
Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardea alba		
Great Egret, White Egret [59541]		Breeding known to occur within area
Ardea ibis		
Cattle Egret [59542]		Breeding likely to occur within area
Calidris ferruginea		
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Cuculus saturatus		
Oriental Cuckoo, Himalayan Cuckoo [710]		Species or species habitat known to occur within area
Gallinago hardwickii		
Latham's Snipe, Japanese Snipe [863]		Species or species habitat may occur within area
Haliaeetus leucogaster		
White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area
Hirundapus caudacutus		
White-throated Needletail [682]		Species or species habitat known to occur within area

Name	Threatened	Type of Presence
[Lathamus discolor](#) Swift Parrot [744]	Critically Endangered	Species or species habitat may occur within area
[Limosa lapponica](#) Bar-tailed Godwit [844]		Species or species habitat known to occur within area
[Merops ornatus](#) Rainbow Bee-eater [670]		Species or species habitat may occur within area
[Monarcha melanopsis](#) Black-faced Monarch [609]		Species or species habitat known to occur within area
[Monarcha trivirgatus](#) Spectacled Monarch [610]		Species or species habitat known to occur within area
[Myiagra cyanoleuca](#) Satin Flycatcher [612]		Species or species habitat known to occur within area
[Numenius madagascariensis](#) Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
[Pachyptila turtur](#) Fairy Prion [1066]		Species or species habitat likely to occur within area
[Pandion haliaetus](#) Osprey [952]		Species or species habitat known to occur within area
[Puffinus carneipes](#) Flesh-footed Shearwater, Fleshy-footed Shearwater [1043]		Species or species habitat likely to occur within area
[Rhipidura rufifrons](#) Rufous Fantail [592]		Species or species habitat likely to occur within area
[Rostratula benghalensis (sensu lato)](#) Painted Snipe [889]	Endangered*	Species or species habitat likely to occur within area
[Tringa nebularia](#) Common Greenshank, Greenshank [832]		Species or species habitat likely to occur within area

Extra Information

Invasive Species

[Resource Information]

Weeds reported here are the 20 species of national significance (WoNS), along with other introduced plants that are considered by the States and Territories to pose a particularly significant threat to biodiversity. The following feral animals are reported: Goat, Red Fox, Cat, Rabbit, Pig, Water Buffalo and Cane Toad. Maps from Landscape Health Project, National Land and Water Resouces Audit, 2001.

Name	Status	Type of Presence
Birds		
Acridotheres tristis Common Myna, Indian Myna [387]		Species or species habitat likely to occur within area
Anas platyrhynchos Mallard [974]		Species or species habitat likely to occur within area
Carduelis carduelis European Goldfinch [403]		Species or species habitat likely to occur within area
Columba livia Rock Pigeon, Rock Dove, Domestic Pigeon [803]		Species or species habitat likely to occur within area
Lonchura punctulata Nutmeg Mannikin [399]		Species or species habitat likely to occur within area
Passer domesticus House Sparrow [405]		Species or species habitat likely to occur within area
Streptopelia chinensis Spotted Turtle-Dove [780]		Species or species habitat likely to occur within area
Sturnus vulgaris Common Starling [389]		Species or species habitat likely to occur within area
Frogs		
Rhinella marina Cane Toad [83218]		Species or species habitat likely to occur within area
Mammals		
Bos taurus Domestic Cattle [16]		Species or species habitat likely to occur within area
Canis lupus familiaris Domestic Dog [82654]		Species or species habitat likely to occur within area
Felis catus Cat, House Cat, Domestic Cat [19]		Species or species habitat likely to occur within area
Feral deer Feral deer species in Australia [85733]		Species or species habitat likely to occur within area
Lepus capensis Brown Hare [127]		Species or species habitat likely to occur within area
Mus musculus House Mouse [120]		Species or species habitat likely to occur within area
Oryctolagus cuniculus Rabbit, European Rabbit [128]		Species or species habitat likely to occur

Name	Status	Type of Presence within area
Rattus norvegicus Brown Rat, Norway Rat [83]		Species or species habitat likely to occur within area
Rattus rattus Black Rat, Ship Rat [84]		Species or species habitat likely to occur within area
Sus scrofa Pig [6]		Species or species habitat likely to occur within area
Vulpes vulpes Red Fox, Fox [18]		Species or species habitat likely to occur within area
Plants		
Annona glabra Pond Apple, Pond-apple Tree, Alligator Apple, Bullock's Heart, Cherimoya, Monkey Apple, Bobwood, Corkwood [6311]		Species or species habitat may occur within area
Anredera cordifolia Madeira Vine, Jalap, Lamb's-tail, Mignonette Vine, Anredera, Gulf Madeiravine, Heartleaf Madeiravine, Potato Vine [2643]		Species or species habitat likely to occur within area
Asparagus aethiopicus Asparagus Fern, Ground Asparagus, Basket Fern, Sprengi's Fern, Bushy Asparagus, Emerald Asparagus [62425]		Species or species habitat likely to occur within area
Asparagus africanus Climbing Asparagus, Climbing Asparagus Fern [66907]		Species or species habitat likely to occur within area
Cabomba caroliniana Cabomba, Fanwort, Carolina Watershield, Fish Grass, Washington Grass, Watershield, Carolina Fanwort, Common Cabomba [5171]		Species or species habitat likely to occur within area
Chrysanthemoides monilifera Bitou Bush, Boneseed [18983]		Species or species habitat may occur within area
Chrysanthemoides monilifera subsp. rotundata Bitou Bush [16332]		Species or species habitat likely to occur within area
Cryptostegia grandiflora Rubber Vine, Rubbervine, India Rubber Vine, India Rubbervine, Palay Rubbervine, Purple Allamanda [18913]		Species or species habitat likely to occur within area
Dolichandra unguis-cati Cat's Claw Vine, Yellow Trumpet Vine, Cat's Claw Creeper, Funnel Creeper [85119]		Species or species habitat likely to occur within area
Eichhornia crassipes Water Hyacinth, Water Orchid, Nile Lily [13466]		Species or species habitat likely to occur within area
Hymenachne amplexicaulis Hymenachne, Olive Hymenachne, Water Stargrass, West Indian Grass, West Indian Marsh Grass [31754]		Species or species habitat likely to occur within area
Lantana camara Lantana, Common Lantana, Kamara Lantana, Large-leaf Lantana, Pink Flowered Lantana, Red Flowered Lantana, Red-Flowered Sage, White Sage, Wild Sage [10892]		Species or species habitat likely to occur within area
Opuntia spp. Prickly Pears [82753]		Species or species habitat likely to occur within area
Parthenium hysterophorus Parthenium Weed, Bitter Weed, Carrot Grass, False		Species or species

Name	Status	Type of Presence
Ragweed [19566]		habitat likely to occur within area
Prosopis spp. Mesquite, Algaroba [68407]		Species or species habitat likely to occur within area
Protasparagus densiflorus Asparagus Fern, Plume Asparagus [5015]		Species or species habitat likely to occur within area
Rubus fruticosus aggregate Blackberry, European Blackberry [68406]		Species or species habitat likely to occur within area
Sagittaria platyphylla Delta Arrowhead, Arrowhead, Slender Arrowhead [68483]		Species or species habitat likely to occur within area
Salix spp. except S.babylonica, S.x calodendron & S.x reichardtii Willows except Weeping Willow, Pussy Willow and Sterile Pussy Willow [68497]		Species or species habitat likely to occur within area
Salvinia molesta Salvinia, Giant Salvinia, Aquarium Watermoss, Kariba Weed [13665]		Species or species habitat likely to occur within area
Senecio madagascariensis Fireweed, Madagascar Ragwort, Madagascar Groundsel [2624]		Species or species habitat likely to occur within area
Reptiles		
Hemidactylus frenatus Asian House Gecko [1708]		Species or species habitat likely to occur within area
Ramphotyphlops braminus Flowerpot Blind Snake, Brahminy Blind Snake, Cacing Besi [1258]		Species or species habitat likely to occur within area

Caveat

The information presented in this report has been provided by a range of data sources as acknowledged at the end of the report.

This report is designed to assist in identifying the locations of places which may be relevant in determining obligations under the Environment Protection and Biodiversity Conservation Act 1999. It holds mapped locations of World and National Heritage properties, Wetlands of International and National Importance, Commonwealth and State/Territory reserves, listed threatened, migratory and marine species and listed threatened ecological communities. Mapping of Commonwealth land is not complete at this stage. Maps have been collated from a range of sources at various resolutions.

Not all species listed under the EPBC Act have been mapped (see below) and therefore a report is a general guide only. Where available data supports mapping, the type of presence that can be determined from the data is indicated in general terms. People using this information in making a referral may need to consider the qualifications below and may need to seek and consider other information sources.

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species distributions have been derived through a variety of methods. Where distributions are well known and if time permits, maps are derived using either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc) together with point locations and described habitat; or environmental modelling (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where very little information is available for species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc). In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More reliable distribution mapping methods are used to update these distributions as time permits.

Only selected species covered by the following provisions of the EPBC Act have been mapped:

- migratory and
- marine

The following species and ecological communities have not been mapped and do not appear in reports produced from this database:

- threatened species listed as extinct or considered as vagrants
- some species and ecological communities that have only recently been listed
- some terrestrial species that overfly the Commonwealth marine area
- migratory species that are very widespread, vagrant, or only occur in small numbers

The following groups have been mapped, but may not cover the complete distribution of the species:

- non-threatened seabirds which have only been mapped for recorded breeding sites
- seals which have only been mapped for breeding sites near the Australian continent

Such breeding sites may be important for the protection of the Commonwealth Marine environment.

This product is projected into:
GDA 1994 MGA Zone 56

Labels for Essential Habitat are centred on the area of enquiry.

Regional ecosystem linework has been compiled at a scale of 1:100 000, except in designated areas where a compilation scale of 1:50 000 is available. Linework should be used as a guide only. The positional accuracy of RE data mapped at a scale of 1:100 000 is +/- 100 metres.

Additional information may be required for the purposes of land clearing or assessment of a regional ecosystem map or PMAV applications. For further information go to the web site: www.dnrm.qld.gov.au or contact the Department of Natural Resources and Mines.

Digital data for the vegetation management watercourse and drainage feature map, vegetation management wetlands map, essential habitat map and the vegetation management remnant and regional ecosystem map are available from the Queensland Spatial Portal at http://www.information.qld.gov.au/

Vegetation Management Act 1999 - Extract from the essential habitat database

Essential habitat is required for assessment under the:

- State Development Assessment Provisions - Module 8: Native vegetation clearing which sets out the matters of interest to the state for development assessment under the *Sustainable Planning Act 2009*; and
- Self-assessable vegetation clearing codes made under the *Vegetation Management Act 1999*

Essential habitat for one or more of the following species is found on and within 1.1 km of the identified subject lot/s or on and within 2.2 km of an identified coordinate on the accompanying essential habitat map.

This report identifies essential habitat in Category A, B and Category C areas.

The numeric labels on the essential habitat map can be cross referenced with the database below to determine which essential habitat factors might exist for a particular species.

Essential habitat is compiled from a combination of species habitat models and buffered species records.

The Department of Natural Resources and Mines website (http://www.dnrm.qld.gov.au) has more information on how the layer is applied under the State Development Assessment Provisions - Module 8: Native vegetation clearing and the *Vegetation Management Act 1999*.

Regional ecosystem is a mandatory essential habitat factor, unless otherwise stated.

Essential habitat, for protected wildlife, means a category A area, a category B area or category C area shown on the regulated vegetation management map-

1) (a) that has at least 3 essential habitat factors for the protected wildlife that must include any essential habitat factors that are stated as mandatory for the protected wildlife in the essential habitat database; or
2) (b) in which the protected wildlife, at any stage of its life cycle, is located.

Essential habitat identifies endangered or vulnerable native wildlife prescribed under the *Nature Conservation Act 1994*.

Essential habitat in Category A and B (Remnant vegetation species record) areas:1100m Species Information

(no results)

Essential habitat in Category A and B (Remnant vegetation species record) areas:1100m Regional Ecosystems Information

(no results)

Essential habitat in Category A and B (Remnant vegetation) areas:1100m Species Information

Label	Scientific Name	Common Name	NCA Status	Vegetation Community	Altitude	Soils	Position in Landscape
686	Crinia tinnula	Wallum Froglet	V	Vegetation community is a mandatory essential habitat factor for this species. Permanent to ephemeral acidic (pH 4.3 - 5.2), soft freshwater in Melaleuca (e.g. M. quinquenervia) swamps, sedgeland, wet and dry heathland (e.g. Banksia robur, Xanthorrhoea) and wallum (Banksia aemula shrubland/woodland) areas coastal lowlands on sand or sandstone, occasionally in adjacent open forest/woodland (e.g. Eucalyptus racemosa, Corymbia citriodora) with heathy understorey; known to persist in small remnants (<10ha); may be found well away from water.	Sea level to 200m.	Sandy and sandy-alluvial substrates.	None

Essential habitat in Category A and B (Remnant vegetation) areas:1100m Regional Ecosystems Information

Label	Regional Ecosystem (this is a mandatory essential habitat factor, unless otherwise stated)
686	12.2.5, 12.2.7, 12.2.9, 12.2.10, 12.2.12, 12.2.15, 12.3.4, 12.3.5, 12.3.6, 12.3.12, 12.3.14, 12.5.10. These regional ecosystems are not a mandatory essential habitat factor for this species.

Essential habitat in Category C (High value regrowth vegetation) areas:1100m Species Information

(no results)

Essential habitat in Category C (High value regrowth vegetation) areas:1100m Regional Ecosystems Information

CODES

I - Y indicates that the taxon is introduced to Queensland and has naturalised.

Q - Indicates the Queensland conservation status of each taxon under the *Nature Conservation Act 1992.* The codes are Extinct in the Wild (PE), Endangered (E), Vulnerable (V), Near Threatened (NT), Least Concern (C) or Not Protected ( ).

A - Indicates the Australian conservation status of each taxon under the *Environment Protection and Biodiversity Conservation Act 1999.* The values of EPBC are Conservation Dependent (CD), Critically Endangered (CE), Endangered (E), Extinct (EX), Extinct in the Wild (XW) and Vulnerable (V).

Records – The first number indicates the total number of records of the taxon for the record option selected (i.e. All, Confirmed or Specimens).
This number is output as 99999 if it equals or exceeds this value. The second number located after the / indicates the number of specimen records for the taxon.
This number is output as 999 if it equals or exceeds this value.

Important Information Relating to this Report

1.0 INTRODUCTION

Brisbane Airport Corporation Pty Ltd (BAC) commissioned Golder Associates Pty Ltd (Golder) to undertake an Acid Sulfate Soil (ASS) assessment for Stage 1 of the Auto Mall Precinct project at the Brisbane Airport (see Figure 1). Golder has previously conducted a desktop study contamination and acid sulfate soil review of the Auto Mall Precinct for BAC (reference 1460490-002-R-Rev0, February 2015). The purpose of the current assessment is to inform the detailed design of the proposed development.

The ASS investigation was undertaken during December 2015 as part of a combined geotechnical, contamination and ASS investigation and is based on the scope of work defined in our proposal (Golder document reference no. P1538021-002-L-Rev1 dated 12 October 2015). A supplementary investigation was completed in October 2016 at an additional 3 locations in the central portion of Stage 1 where dense vegetation had prevented access during the December 2015 investigation.

This updated report presents the ASS assessment findings of the original and supplementary investigations at Stage 1 of the Auto Mall Precinct. The assessment results from the geotechnical and contamination investigations are provided in a separate reports.

2.0 PROJECT DETAILS

An Auto Mall Precinct is proposed to be developed on an area between Moreton Drive, Nancy Bird Way and Airport Drive at the Brisbane Airport. Refer attached Figure 1 for the location plan. The proposed development comprises a test track in the middle of the site, surrounded by development lots for future commercial use. Private roads are located around the perimeter of the site. An Energex substation and easement is present on the site.

At the time of issuing this report, we understand that the site is to be developed in three stages as follows:

- Development Stage 1: Track, roads and selected development lots; lots north of the Energex easement between the track and Moreton Drive, and the Track and Nancy Bird Way.
- Development Stage 2: development lots south of the Energex easement.
- Development Stage 3: development lots north of the Energex easement between the track and Airport Drive.

The current staging plan is provided in Appendix A.

It is expected that the majority of the site will be filled and surcharged to achieve final development design levels. Drainage channels will run along site perimeter, with invert levels as low as of RL 0.2 m AD in the western portion of the site. Site drainage channels will discharge into nearby surface water drains.

However, for consistency with previous works, we refer to the portion of the site north of the Energex easement as Stage 1, and the portion to the south as Stage 2.

3.0 SITE DESCRIPTION

The site has an average surface level of about 2.4 m AD[1] and is currently heavily vegetated with casuarina forest and mangroves. The Stage 1 investigation area covers approximately 950 m by 450 m.

Landers Pocket drain is the closet surface water body feature, located at least 100 m west of the project area. Surface water in Landers Pocket drain flows north east for 1 km from the site before discharging into Kedron Brook Floodway Drain. The Kedron Brook Floodway Drain discharges into Kedron Brook. The ultimate receiving environment of surface water is Moreton Bay from Kedron Brook.

[1] Aerodrome Datum

4.0 BACKGROUND INFORMATION

4.1 About Acid Sulfate Soils

Pyritic soils or ASS, were deposited in coastal zones throughout the world during the last 6,500 to 10,000 years. When drained for development or otherwise disturbed, the iron pyrite in these sediments oxidises producing sulfuric acid which subsequently lowers the pH in runoff and groundwater, leading to the release of toxic aluminium and iron from the sediments.

The formation of ASS is commonly the result of marine or estuarine deposition of sulfate and iron bearing sediments in the presence of an abundant source of readily decomposable organic matter resulting in the deposition of pyrite. This pyrite is stable within the soil so long as anoxic conditions prevail. Oxidation of this material produces acidic conditions, a process that typically occurs when the material is exposed to air, such as when raised above the water table by excavation, or by lowering the water table during dewatering processes. This can occur as a result of natural processes, for example as a result of fluctuations in the seawater level.

Acidic water introduced into coastal streams can cause fish kills, alterations to ecosystems and corrosion of civil structures. The source of the acid is naturally occurring pyrite. Environmental degradation occurs when this pyrite oxidises and sulfuric acid is produced and discharged into receiving waters. If receiving water in ASS areas is naturally saline, low level acidity naturally generated is often adequately buffered by the salinity and sometimes by the presence of alkaline calcareous materials present within the alluvial deposits.

Previous experience and available guidelines indicate that ASS are normally restricted in extent to recent (Holocene age) soil horizons deposited in a saline environment below RL 5 m AHD, with Actual ASS (AASS) often occurring at the top of the soil profile, being underlain by Potential ASS (PASS). ASS commonly occurs throughout lowland coastal areas of Australia.

4.2 Previous Investigations

Golder previously conducted a desktop assessment of ASS, groundwater and contamination for the Auto Mall Precinct in 2014. The findings of this desktop assessment were reported in Golder report reference No. 1416490-002-Rev0 and indicated the following:

- Sub-surface conditions typically comprise:

  Crust – A clay 'crust' layer up to 1.0 m bgl is present in some areas due to desiccation.

  Younger Alluvium (Holocene) – Highly compressible, inter-bedded sandy clays and clayey sands (Upper Holocene) and silty clays (Lower Holocene) extending to depths up to 30 m below ground level in places.

- Shallow surface fill may be present on the edges of the site with depths ranging from 0.15m to 1.1m. The fill was a mix of silts and sandy clays with some sands. The underlying natural profiles (upper Holocene alluvium) comprised variable light, medium and heavy clays and clayey sands, with some thin layers of peat and 'clean' sands. The natural soils were generally grey to dark grey and dark brown, indicative of ASS.
- Field screening and laboratory analysis of site soils indicated the presence of actual acid sulfate soils (AASS) typically from the surface to depth of about 0.6m to 1.1 m AD underlain by potential acid sulfate soils (PASS) to depths of more than 1.2 m AD (the limit of previous ASS investigations).
- The acid neutralising capacity (ANC) of the alluvium is generally not adequate to naturally buffer the actual and potential acidity produced.
- Net acidity in the AASS materials ranged from 0.08 S% to about 1.94 S%. Net acidity in the PASS materials ranged from 0.06 S% to about 2.55 S%.

To assist in the current assessment of ASS soil conditions, previous investigation results have been included in this current assessment. In particular previous ASS results for investigation locations BIP/ASS6, BIP/ASS8, BIP/ASS9 and BIP/ASS10 (Golder report reference No. 097632009-2001-R-Rev0 Brisbane International Precinct Stage A, Acid Sulfate Soil Investigation, dated April 2009). Figure 1 displays the previous ASS investigation locations.

4.3 Geology

Reference to the Geological Survey of Queensland 1:100,000 scale Brisbane Geological map (1990) indicates that all of the assessment site is located on alluvial deposits of Holocene age.

Holocene deposits are typically associated with ASS formation.

4.4 Hydrogeology

Previous investigations in this area have encountered groundwater levels ranging from about 1.6m AD to 2.5m AD with a general direction of groundwater flow has been inferred as west towards Landers Pocket Drain.

4.5 Soil Landscape

The "Soil Landscapes of Brisbane and South-Eastern Environs, Queensland", CSIRO 1:100,000 scale Map Sheet (1985) indicates that the assessment site is situated within an alluvial landscape likely to comprise the following soil group:

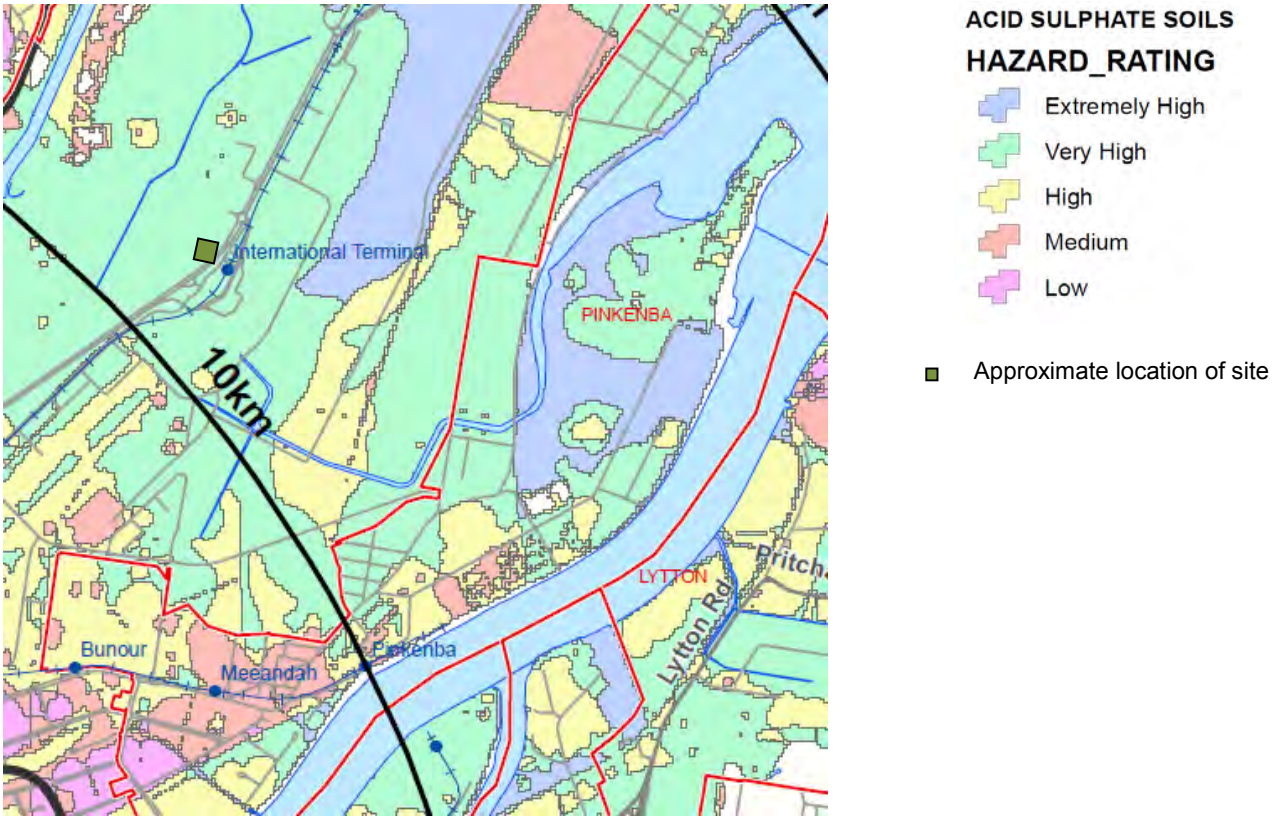
Woongoolba- WO

- Dominant Soil Group – 'Humic gleys, peaty gleys' and 'solonchaks'
- Landscape and Parent Geology – Low (coastal) plains of alluvium and narrow depressions.

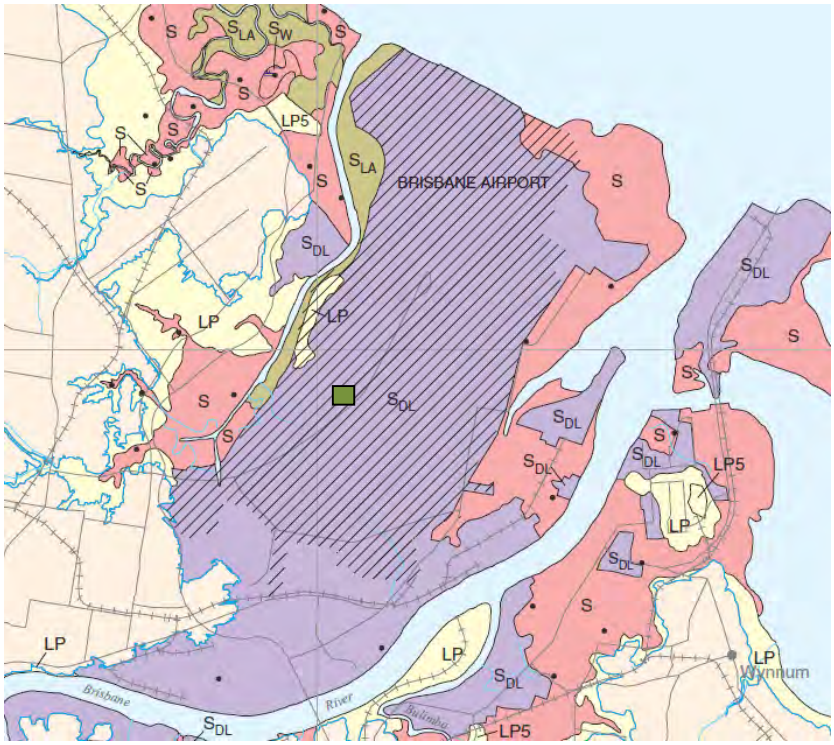
This soil profile is a young alluvium that frequently contains moderate to high concentrations of pyritic material and fine organic matter. This soil unit is generally associated with ASS.

4.6 ASS Risk Maps

The Brisbane City Council "A Guide to the Likely Location of Acid Sulfate Soils in Brisbane" 1:50,000 scale risk map, indicates that the site is situated in an area mapped as having a 'Very High' risk of encountering ASS (refer below). The 'Very High' risk ASS soils at the site are likely to be associated with the recent alluvial soils.



Brisbane City Council ASS Hazard Risk Map for the Site



Approximate location of site

DNRM Acid Sulfate Soils Map for the Site

The Department of Natural Resources Mines (DNRM), 1:100,000 scale Map 1 "Acid Sulfate Soils –Tweed Heads to Redcliffe" (refer above), indicates that the site is situated in an area mapped as:

- SDL – Disturbed land (e.g. canal estates, marinas, aquaculture, quarry, urban, and industrial likely to contain ASS. (In some cases, partial or full treatment may have been undertaken). Limited field investigation.

5.0 REGULATORY FRAMEWORK

The following key regulatory drivers and guidance documents have been considered and utilised in conducting this assessment:

- *Guidelines for Sampling and Analysis of Lowland Acid Sulfate Soils in Queensland – 1998.* QASSIT
- *Queensland Acid Sulfate Soil Technical Manual: Soil Management Guidelines*. 2014. Department of Science, Information Technology, Innovation and the Arts, Queensland Government.

6.0 FIELDWORK

6.1 Soil Investigation

Details of the soil investigation methodology for the ASS investigation is summarised in Table 1 below.

Table 1: Field Activities - Drilling and Soil Sampling

Activity	Details
Drilling	Soil sampling for the original acid sulfate soil assessment was conducted from 16 to 18 December 2015 which included 12 boreholes identified as AM-BH1 to AM-BH9, AM-BH17, AM-BH19 and AM-BH28. The supplementary investigation was conducted on 10 October 2016 and comprised 3 boreholes identified at AM-BH30, AM-BH31 and AM-BH32. The boreholes were advanced to depths of 3m using hollow stem augers mounted on a light tracked vehicle. Soil samples were collected using an SPT spilt tube. The sampling was conducted in conjunction with contamination and geotechnical investigations for the site. Borehole drilling was carried out under the supervision of a geotechnical engineer from Golder. Soil descriptions for the lithology encountered during drilling are presented as borehole logs in Appendix B.
Borehole Survey	Upon completion of intrusive investigations selected locations were surveyed by MPA Surveyors using differential GPS for easting, northing and RL. Remaining locations and levels were inferred from the survey plan provided by BAC (received 24 November 2015).
Soil Sampling	Soil samples were collected at 0.25 m intervals from the surface to 3m below ground level (bgl) for ASS testing.
Samples Preservation and Handling	All ASS samples were labelled and sealed in plastic bags and refrigerated, then frozen within 24 hours, until laboratory testing was undertaken. All samples collected were sent to Australian Laboratory Services (ALS) of Brisbane under Chain of Custody (CoC) procedure (documents in Appendix C).
Soil Screening	All soil samples were screened using the pH_F/pH_{FOX} test method.
Soil Analysis	Soil samples were selected on the basis of the screening test results for quantitative laboratory analyses by the Chromium Suite test method (laboratory documents in Appendix C).

6.2 Groundwater Investigation

Details of groundwater investigation methodology are summarised in Table 2 below.

Table 2: Field Activities - Groundwater Well Installation and Sampling

Activity	Details
Monitoring Well Installation and Construction	Five boreholes (AM-BH01, AM-BH04, AM-BH08, AM-BH19 and AM-BH28) were converted into new groundwater monitoring wells during the original investigation. During the supplementary investigation, one borehole (AM-BH31) was converted into a new groundwater monitoring well. **Figure 1** displays the monitoring well locations installed during this assessment and existing historical monitoring wells (BIP/MW1, BIP/MW2, BIP/MW6, BAC-MW07 and BAC-MW-24). New monitoring wells were constructed using 50 mm, Class 18 PVC threaded screen and casing. Construction details for monitoring wells are presented on borehole reports in Appendix B.
Well Development	Following installation the new wells were developed using dedicated disposable bailers.
Well Gauging	Standing water levels (SWLs) were measured in the original investigation wells and historical wells on 4 January 2016 using a calibrated water level meter. The SWL in the supplementary well was measured on 25 October 2016. Groundwater gauging data are presented in Section 6.2 Table 2.
Well Purging	On 4 January 2016, the wells were using dedicated disposable bailers. On 25 October 2016 purging was completed using a low flow peristaltic pump, equipped with disposable tubing. Groundwater quality parameters and visual observations were recorded during purging. Purging continued until three well volumes were removed or to stabilisation of quality parameters.
Groundwater Sampling	Groundwater samples were collected from all new and existing wells using new disposable bailers on 4 January 2016 and directly from the pump on 25 October 2016.
Sample Preservation and Handling	Collected water samples were placed in laboratory supplied containers. Samples were placed with ice, in eskies whilst on-site and in transit to the laboratory. All samples were sent to Australian Laboratory Services (ALS) of Brisbane under Chain of Custody (CoC) procedures (documents in Appendix C).
Groundwater Analysis	Groundwater samples were analysed for ASS indicator parameters comprising pH, electrical conductivity, chloride, sulfate, alkalinity, acidity, dissolved iron, dissolved aluminium and total iron. Laboratory analytical reports are presented in Appendix C.

7.0 ASSESSMENT CRITERIA

Table 3 below shows the ASS action levels adopted in Queensland. These categories are used to identify whether action / management of ASS disturbances is required, based on 'net acidity' (derived from the results of the Chromium Suite analysis or the Chromium Suite test suites). For this assessment an action criteria of 0.03% Equivalent Sulfur has been adopted.

Table 3: ASS Action Criteria

Type of Material		Action Criteria 1-1000 tonnes disturbed		Action Criteria > 1000 tonnes disturbed (and major fill projects)	
		Existing + Potential Acidity		Existing + Potential Acidity	
Texture range McDonald et al. (1990)	**Approx clay content (%)**	**Equivalent sulfur %S oxidisable**	**Equivalent acid mol H^+/ tonne**	**Equivalent sulfur %S oxidisable (oven-dry basis)**	**Equivalent acid mol H^+/ tonne (oven-dry basis)**
Coarse Texture Sands to loamy sands	≤5	0.03	18	0.03	18*
Medium Texture Sandy loams to light clays	5 – 40	0.06	36	0.03	18*
Fine Texture Medium to heavy clays and silty clays	≥40	0.10	62	0.03	18*

Table 4 below (*Treatment and management of soils and water in acid sulfate soil landscapes*, July 2011, revised 2015, WA DEC) provides a guide for the assessment of the buffering capacity of groundwater.

Table 4: General Indicators for Buffering Capacity

Class	Designation	Alkalinity		pH	Description
		mg/L	meq./L		
1	Very high alkalinity	>180	>3	>6.5	Adequate to maintain acceptable pH level in the future.
2	High alkalinity	60-80	1-3	>6.0	Adequate to maintain acceptable pH level in the future.
3	Moderate alkalinity	30-60	0.5-1.0	5.5-7.5	Inadequate to maintain stable, acceptable pH level in areas vulnerable to acidification.
4	Low alkalinity	10-30	0.2-0.5	5.0-6.0	Inadequate to maintain stable, acceptable pH level.
5	Very low alkalinity	<10	<0.2	<6.0	Unacceptable pH level under all circumstances.

8.0 INVESTIGATION FINDINGS

8.1 Subsurface Conditions

Detailed information of subsurface conditions encountered at the site are described in Report of Boreholes (Appendix B).

A summary of typical subsurface conditions encountered is as follows:

- **Crust** – A desiccated layer generally comprising loose silty sand and sandy clay generally between 0.1 to 0.3 m bgl, over
- **Recent Alluvium (Holocene)** – Compressible, inter-bedded sandy clays and clayey sands (Upper Holocene) from approximately 0 to 3 m bgl (target depth).

8.2 Groundwater Levels

Table 5 summarises the groundwater measurements for the current investigation. It should be noted that BAC has not provided Golder with construction details for wells BAC-MW07 and BAC-MW24 at the time of this report. Based on the measured groundwater levels, the general flow direction beneath the site is interpreted to be west.

Table 5: Summary of Groundwater Level Observations

Well ID	Depth to Groundwater (m bgl)	Groundwater RL (m AD)	Date and Time of Observations
AM-BH01	0.93	2.06	04/01/2016 AT 12:00 PM
AM-BH04	1.41	1.26	04/01/2015 AT 12.36 PM
AM-BH08	1.13	1.75	04/01/2016 AT 12:50 PM
AM-BH19	0.71	1.91	04/01/2016 AT 1:05 PM
AM-BH28	0.76	1.98	04/01/2016 AT 12:20 PM
BIP/MW1	1.27	1.53	04/01/2016 AT 12.36 PM
BIP/MW2	1.07	1.91	04/01/2016 AT 11:00 AM
BP/MW6	1.02	2.01	04/01/2016 AT 11:30 AM
BAC-MW07	1.24	1.66	04/01/2016 AT 1:32 PM
BAC-MW24	0.81	2.13	04/01/2016 AT 10:30 AM
AM-MW31	0.95	1.8	25/10/2016 AT 12:30 PM

8.3 ASS Screening Tests

The pH_F/pH_{FOX} screening method consists of two steps; determining the field pH of a 1:5 soil/water suspension, and by the addition of 30% Hydrogen Peroxide, allowing the sample time to oxidise, before determining the pH_{FOX} (pH after oxidation) of the reacted sample. A significant drop in pH is indicative of potential acidity and a low initial pH, indicative of actual acidity.

The tests are used to indicate the likelihood of a soil containing actual acidity (i.e. Actual ASS [AASS]) and/or potential acidity (i.e. Potential ASS [PASS]).

The following rating is used in the assessment of samples in the attached table:

1) AASS potential is indicated by; Nil ($pH_F > 4.5$), Medium (pH_F 4.5< $pH_F \leq 4$), High ($pH_F < 4$)

2) PASS potential is indicated by: Low ($pH_{FOX} > 3$), Medium ($pH_{FOX} > 3$ and difference between pH_{FOX} and pHFOX is greater than 3, High (pHFOX < 3).

3) Where the pHFOX value is significantly less than the reported pHF, this may indicate the presence of PASS, with larger reductions in pHFOX generally providing a stronger indication of potential PASS.

The rate of reaction is also an indicator of likely PASS.

Field screening test results on recovered soil samples during the investigation are presented in Appendix C and summarised in Table 6 below.
The screening test results from the current investigations indicated the following:

- The pH_F values materials ranged between 3.8 and 8.5. The likely presence of AASS was indicated at all investigation locations with the expection of AM-BH09. Field tests generally indicated the presence of AASS from the surface levels between about 0.8m AD and 1.2m AD (ie. extending below the measured water table). At location AM-BH19 the presence of AASS was indicated from the surface to the full depth of investigation.
- The pH_{FOX} values suggest a high potential for PASS underlying the AASS to a level of at least -0.54 m AD, the maximum investigation depth.

Table 6: Acid Sulfate Soil Screening Test Results (continued)

Location ID	Sample Depth Range (m bgl)			Sample Depth Range (m AD)			Soil Type	pH (F)	AASS Likelihood[1]	pH (Field ox)	Reaction Rate [2]	PASS Likelihood[3]
								pH Unit		pH_Units

1) AASS likelihood is indicated by; Nil ($pH_F > 4.5$), Medium (pH_F 4.5< $pH_F \leq 4$), High ($pH_F < 4$)

2) PASS likelihood is indicated by: Low ($pH_{FOX} > 3$), Medium ($pH_{FOX} > 3$ and difference between pH_{FOX} and pH_{FOX} is greater than 3, High ($pH_{FOX} < 3$).

3) Reaction 1 = Low strength, 2 = Medium strength, 3 = High strength, 4 = Extreme

8.4 Chromium Suite Analysis

Based on screening test results, a total of 41 soil samples (2 to 3 per borehole) were selected for laboratory analysis by the Chromium Suite test methods. The soil samples were selected to target samples with field screening tests showing high AASS or PASS potential and to provide a broad coverage of the soil profile.

Results of laboratory testing including acid base accounting to calculate net acidity are summarised in Table 7. Table 7 includes previous ASS investigation results for BIP/ASS6, BIP/ASS8, BIP/ASS9 and BIP/ASS10.

Laboratory results indicated:

- The presence of AASS was confirmed in layers consistent with indications from the field screening tests. Although deeper layers of AASS were indicated in AM-BH5, AM-BH7, AM-BH8 and in samples from AM-BH17 were field screening had not previously indicated AASS. Closer inspection of these results suggests that minor oxidisation may have occurred these samples at the laboratory between field screening and the Chromium Suite testing – for the purposes of this assessment we have considered these suspect results to indicate PASS rather than AASS. Excluding these suspect results, AASS materials across the site have required liming rates for net acidity ranging from about 4 kg/m^3 to 30 kg/m^3.
- Net Acidity in PASS materials varies considerably across the site. In general the PASS material towards the southern and northern ends of the site have indicated liming rates ranging from about 15 kg/m^3 to 60 kg/m^3. Through the centre of the site (AM-BH7, AM-BH8, AM-BH17, AM-BH28, BIP/ASS2, BIP/ASS3,BIP/ASS4, AM-BH31 and AM-BH32) much higher net acidity was indicated with liming rates generally ranging from about 90 kg/m^3 to 180 kg/m^3 and as high as 320 kg/m^3 in one sample (AM-BH17, 0.21-0.04m AD).

AM-MW31	25/10/2016	6.20	31.1	12.2	0.10	13300:2620 (5.1)	242	341

Notes: Rainfall in the 30 days prior to 4/01/2016 sampling round was 230mm and 30 days prior to 25/10/2016 was 35.6mm.
*Field measurement

The laboratory results indicated:

- Electrical conductivity ranging from 22 to 50 mS/cm indicating saline water conditions.
- pH levels ranging from 4.3 to 6.85 (with lowest levels in wells along the western site boundary) indicating acidic to near neutral conditions.
- The buffering capacity of the wells varied across the site. The northern end of Stage 1 area had very high alkalinity with a Class 1 buffering capacity (i.e. adequate to maintain acceptable pH level in the future). The remainder of the Stage 1 area had a moderate alkalinity with a Class 3 buffering capacity (i.e. inadequate to maintain stable, acceptable pH level in areas vulnerable to acidification). It was noted that BIP/MW1 which is hydraulically downgradient of the site was acidic with a Class 5 buffering capacity (i.e. unacceptable pH level under all circumstances) and is likely to indicate historical disturbance (ASS dewatering) in this area.
- Dissolved aluminium concentrations of greater than about 1 mg/L in groundwater may be an indicator of AASS. Concentrations where below the laboratory detection limit, with the exception of AM-BH01 (3.59 mg/L), AM-BH19 (0.06 mg/L) and BIP/MW1 (8.18 mg/L). These detected concentrations were also above the Airports (Environmental Protection) Regulations accepted limits for contamination of fresh water of 0.1 mg/L. Concentrations of dissolved aluminium detected at AM-BH01 and BIP/MW1 during this investigation indicate active ASS impact in the groundwater.
- Dissolved iron concentrations ranged from 12.2 to 294 mg/L.
- The Chloride:Sulfate (Cl^-: SO_4^{++}) ratios indicate past oxidation of PASS in this area. This is with the exception of BAC-MW07 and BAC-MW-24 which have Chloride to Sulfate ratios greater than 7 which is that of sea water.

Overall the groundwater results suggest a variable or historically disturbed environment at the investigation locations.

9.0 CONCLUSIONS

The following conclusions have been drawn from the ASS assessment at the Auto Precinct Stage 1 area:

- Investigations of the Stage 1 investigation area indicated that AASS materials are present from the ground surface to levels about 0.8m AD and 1.2m AD and deeper in isolated pockets where previous localised ground disturbances may have occurred. AASS has been detected in materials below the water table which indicates that the groundwater table has been historically lowered in this area. Calculated liming rates to neutralise net acidity in the identified AASS materials (from all investigations) range from about 5 kg/m^3 to 45 kg/m^3.

- PASS materials underlie the AASS materials across the site. Net Acidity in PASS materials varies considerably across the site. Calculated liming rates to neutralise net acidity in the identified PASS materials towards the northern and southern ends of Stage 1 range from about 15 kg/m^3 to 67 kg/m^3. Through the centre of the site much higher net acidity was indicated with liming rates generally ranging from about 90 kg/m^3 to 180 kg/m^3 and as high as 320 kg/m^3 in one sample which commences from 1.46 m AD to -0.25 m AD.

- Groundwater samples suggested a variable or historically disturbed environment. The groundwater has suitable available buffering capacity to maintain an acceptable pH level in the presence of minor acid generation at the northern end of the Stage 1 investigation area. However, groundwater samples from the remainder of the site indicate a buffering capacity inadequate to maintain stable, acceptable pH level in areas vulnerable to acidification. Acid conditions and aluminium concentrations above the Airports (Environmental Protection) Regulations accepted limit were detected in two groundwater samples.

The presence of ASS and low buffering capacity of groundwater have the following implications to the currently proposed development:

- All site excavations will disturb ASS and will require management measures including lime treatment of excavated spoil. Excavation of the proposed perimeter drains to RL 0.2 m AD will result in AASS and PASS spoil which may require separate management measures.

- Filling and surcharging/preloading of the site will result in further AASS being “pushed” below the water table. Surcharging/preloading will also cause a slight mounding of the local water table and result in the temporary saturation of AASS. Both of these issues will result in the release of acid to the groundwater and the subsequent stripping and mobilisation of metals. Acid and metals impacted groundwater may discharge to the surface and/or shallow drains immediately surrounding the site and migrate towards (and discharge into) Landers Pocket Drain. Potential mitigation/management strategies for this issue include:

    - Construction of a lime trench along the western site boundary (or eastern side of the proposed drain along this boundary) to buffer acidic groundwater moving off site. The lime trench would need to extend below the AASS/PASS interface and would comprise a slot trench filled with a mix of agricultural lime and limestone chips.

    - Placement of a 10m wide strip of surface lime ‘guard layer’ along the eastern and southern perimeters of the site under the edge of the fill embankment, prior to filling. This is to neutralise acidic seepage/runoff leaving the site along these boundaries.

    - Installation of limestone filled ‘check’ dams across internal surface drains during construction period and at the end of drains upstream of any connection with Landers Pocket Drain, to neutralise acid ‘flushes’ that may occur. Note that the limestone chips would require monitoring and regular replacement.

  - Monitoring and possible treatment of seepage water collected from any wick drains employed, before discharge off site.

- The proposed perimeter drains will intercept the water table and may result in a zone of localised groundwater depression. Acid and metals impacted groundwater may discharge into the drain. Potential mitigation/management strategies for this issue include:
  - Option 1: Construct a concrete lined drain to maintain groundwater levels outside of the drain and prevent inflow of acidic and degraded groundwater.
  - Option 2: Placement of a lime trench on either side of the drainage channel to neutralise groundwater inflow (this may still allow iron and other metals to floc in the drain and could require additional management measures).

10.0 RECOMMENDATIONS

Based on the investigation findings at the Stage 1 Auto Mall Precinct, it is recommended that:

- A site specific ASS EMP be prepared to manage development disturbances across the Stage 1 investigation area and surcharging practices.

11.0 IMPORTANT INFORMATION

Your attention is drawn to the document titled - “Important Information Relating to this Report”, which is included in Appendix D of this report. The statements presented in that document are intended to inform a reader of the report about its proper use. There are important limitations as to who can use the report and how it can be used. It is important that a reader of the report understands and has realistic expectations about those matters. The Important Information document does not alter the obligations Golder Associates has under the contract between it and its client.

Quote number	: ----	No. of samples analysed	: 55

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ben Felgendrejeris		Brisbane Acid Sulphate Soils, Stafford, QLD
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Gaston Allende	R&D Chemist	Sydney Organics, Smithfield, NSW
Shobhna Chandra	Metals Coordinator	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.

- Due to a Laboratory Error analysis on sample EB1538408-030 (AM-BH02-2.75-3.00) could not be conducted.
- ASS: EA037 (Rapid Field and F(ox) screening): pH F(ox) Reaction Rate: 1 - Slight; 2 - Moderate; 3 - Strong; 4 - Extreme
- EA037 ASS Field Screening: NATA accreditation does not cover performance of this service.
- PFOS and PFOA results are reported as an aggregate of linear and branched isomers.

QUALITY CONTROL REPORT

Work Order	: **EB1538408**	Page	: 1 of 8
Client	: **GOLDER ASSOCIATES**	Laboratory	: Environmental Division Brisbane
Contact	: MS KRYSTLE-RAE BIRAM	Contact	: Tom Maloney
Address	: P O BOX 1734 MILTON QLD, AUSTRALIA 4064	Address	: 2 Byth Street Stafford QLD Australia 4053
E-mail	: kbiram@golder.com.au	E-mail	: Tom.Maloney@alsglobal.com
Telephone	: +61 07 3721 5400	Telephone	: +61-7-3243 7222
Facsimile	: +61 07 3721 5401	Facsimile	: +61-7-3243 7218
Project	: 1538021	QC Level	: NEPM 2013 B3 & ALS QC Standard
Order number	: 1538021	Date Samples Received	: 18-Dec-2015
C-O-C number	: ----	Date Analysis Commenced	: 23-Dec-2015
Sampler	: TAMARA SICCAMA	Issue Date	: 08-Jan-2016
Site	: ----	No. of samples received	: 72
Quote number	: ----	No. of samples analysed	: 55

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

NATA WORLD RECOGNISED ACCREDITATION

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out ir compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ben Felgendrejeris		Brisbane Acid Sulphate Soils, Stafford, QLD
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Gaston Allende	R&D Chemist	Sydney Organics, Smithfield, NSW
Shobhna Chandra	Metals Coordinator	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR:- 0% - 50%; Result > 20 times LOR:0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB1538408**	Page	: 1 of 5
Client	: **GOLDER ASSOCIATES**	Laboratory	: Environmental Division Brisbane
Contact	: MS KRYSTLE-RAE BIRAM	Telephone	: +61-7-3243 7222
Project	: 1538021	Date Samples Received	: 18-Dec-2015
Site	: ----	Issue Date	: 08-Jan-2016
Sampler	: TAMARA SICCAMA	No. of samples received	: 72
Order number	: 1538021	No. of samples analysed	: 55

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **SOIL**

Quality Control Sample Type	Count		Rate (%)		Quality Control Specification
Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)					
Moisture Content	2	24	8.33	10.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
ASS Field Screening Analysis	* EA037	SOIL	In house: Referenced to Acid Sulfate Soils Laboratory Methods Guidelines, version 2.1 June 2004. As received samples are tested for pH field and pH fox and assessed for a reaction rating.
Moisture Content	EA055-103	SOIL	In-house. A gravimetric procedure based on weight loss over a 12 hour drying period at 103-105 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Perfluorooctyl Acids and Sulfonates by LC/MS/MS	EP231	SOIL	In-House. A portion of soil is soaked in sodium hydroxide followed by extraction with methanol. The extract is neutralised with HCl and an aliquot taken to dryness, made up in mobile phase. Analysis is by LC/MSMS, ESI Negative Mode using MRM.
Perfluorinated Compounds by LCMSMS	EP231-PFC	SOIL	In-House. A portion of soil is extracted with MTBE. The extract is taken to dryness, made up in mobile phase. Analysis is by LC/MSMS, ESI Negative Mode using MRM.

Preparation Methods	Method	Matrix	Method Descriptions
Drying only	EN020D	SOIL	In House

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- **PFOS/PFOA analysis will be conducted by ALS Environmental, Sydney, NATA accreditation no. 825, Site No. 10911 (Micro site no. 14913). The expected due date for this data is 11/01/2015.**
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (14 days), Solid (60 days) from date of completion of work order.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exist.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

Project	: 1538021	QC Level	: NEPM 2013 B3 & ALS QC Standard
Order number	: 1538021	Date Samples Received	: 18-Dec-2015 16:00
C-O-C number	: ----	Date Analysis Commenced	: 23-Dec-2015
Sampler	: TAMARA SICCAMA	Issue Date	: 12-Jan-2016 12:51
Site	: ----		
		No. of samples received	: 70
Quote number	: ----	No. of samples analysed	: 55

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Gaston Allende	R&D Chemist	Sydney Organics, Smithfield, NSW
Kim McCabe	Senior Inorganic Chemist	Brisbane Acid Sulphate Soils, Stafford, QLD
Nanthini Coilparampi	Laboratory Manager - Inorganics	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.

- ASS: EA037 (Rapid Field and F(ox) screening): pH F(ox) Reaction Rate: 1 - Slight; 2 - Moderate; 3 - Strong; 4 - Extreme
- EA037 ASS Field Screening: NATA accreditation does not cover performance of this service.
- PFOS and PFOA results are reported as an aggregate of linear and branched isomers.

ALS Environmental

QUALITY CONTROL REPORT

Work Order	: **EB1538415**	Page	: 1 of 6
Client	: **GOLDER ASSOCIATES**	Laboratory	: Environmental Division Brisbane
Contact	: MS KRYSTLE-RAE BIRAM	Contact	: Tom Maloney
Address	: P O BOX 1734 MILTON QLD, AUSTRALIA 4064	Address	: 2 Byth Street Stafford QLD Australia 4053
E-mail	: kbiram@golder.com.au	E-mail	: Tom.Maloney@alsglobal.com
Telephone	: +61 07 3721 5400	Telephone	: +61-7-3243 7222
Facsimile	: +61 07 3721 5401	Facsimile	: +61-7-3243 7218
Project	: 1538021	QC Level	: NEPM 2013 B3 & ALS QC Standard
Order number	: 1538021	Date Samples Received	: 18-Dec-2015
C-O-C number	: ----	Date Analysis Commenced	: 23-Dec-2015
Sampler	: TAMARA SICCAMA	Issue Date	: 12-Jan-2016
Site	: ----	No. of samples received	: 70
Quote number	: ----	No. of samples analysed	: 55

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

NATA WORLD RECOGNISED ACCREDITATION

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out ir compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Gaston Allende	R&D Chemist	Sydney Organics, Smithfield, NSW
Kim McCabe	Senior Inorganic Chemist	Brisbane Acid Sulphate Soils, Stafford, QLD
Nanthini Coilparampi	Laboratory Manager - Inorganics	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR:- 0% - 50%; Result > 20 times LOR:0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB1538415**	Page	: 1 of 5
Client	: **GOLDER ASSOCIATES**	Laboratory	: Environmental Division Brisbane
Contact	: MS KRYSTLE-RAE BIRAM	Telephone	: +61-7-3243 7222
Project	: 1538021	Date Samples Received	: 18-Dec-2015
Site	: ----	Issue Date	: 12-Jan-2016
Sampler	: TAMARA SICCAMA	No. of samples received	: 70
Order number	: 1538021	No. of samples analysed	: 55

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
ASS Field Screening Analysis	* EA037	SOIL	In house: Referenced to Acid Sulfate Soils Laboratory Methods Guidelines, version 2.1 June 2004. As received samples are tested for pH field and pH fox and assessed for a reaction rating.
Moisture Content	EA055-103	SOIL	In-house. A gravimetric procedure based on weight loss over a 12 hour drying period at 103-105 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Perfluorooctyl Acids and Sulfonates by LC/MS/MS	EP231	SOIL	In-House. A portion of soil is soaked in sodium hydroxide followed by extraction with methanol. The extract is neutralised with HCl and an aliquot taken to dryness, made up in mobile phase. Analysis is by LC/MSMS, ESI Negative Mode using MRM.
Perfluorinated Compounds by LCMSMS	EP231-PFC	SOIL	In-House. A portion of soil is extracted with MTBE. The extract is taken to dryness, made up in mobile phase. Analysis is by LC/MSMS, ESI Negative Mode using MRM.

Preparation Methods	Method	Matrix	Method Descriptions

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- **PFOS/PFOA analysis will be conducted by ALS Environmental, Sydney, NATA accreditation no. 825, Site No. 10911 (Micro site no. 14913). The expected due date for his data is 11/01/2016.**
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (14 days), Solid (60 days) from date of completion of work order.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exist.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

Project	: 1538021	QC Level	: NEPM 2013 B3 & ALS QC Standard
Order number	: 1538021	Date Samples Received	: 18-Dec-2015 16:00
C-O-C number	: ----	Date Analysis Commenced	: 23-Dec-2015
Sampler	: TAMARA SICCAMA	Issue Date	: 06-Jan-2016 16:55
Site	: ----		
		No. of samples received	: 77
Quote number	: ----	No. of samples analysed	: 54

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Gaston Allende	R&D Chemist	Sydney Organics, Smithfield, NSW
Hoa Nguyen	Senior Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Kim McCabe	Senior Inorganic Chemist	Brisbane Acid Sulphate Soils, Stafford, QLD Brisbane Inorganics, Stafford, QLD
Matt Frost	Senior Organic Chemist	Brisbane Organics, Stafford, QLD
Nanthini Coilparampi	Laboratory Manager - Inorganics	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.

- EG005T (Total Metals): Sample EB1538312-001 shows poor matrix spike recovery due to sample heterogeneity. Confirmed by visual inspection.
- ASS: EA037 (Rapid Field and F(ox) screening): pH F(ox) Reaction Rate: 1 - Slight; 2 - Moderate; 3 - Strong; 4 - Extreme
- EA037 ASS Field Screening: NATA accreditation does not cover performance of this service.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- PFOS and PFOA results are reported as an aggregate of linear and branched isomers.

QUALITY CONTROL REPORT

Work Order	: **EB1538419**	Page	: 1 of 13
Client	: **GOLDER ASSOCIATES**	Laboratory	: Environmental Division Brisbane
Contact	: MS KRYSTLE-RAE BIRAM	Contact	: Tom Maloney
Address	: P O BOX 1734 MILTON QLD, AUSTRALIA 4064	Address	: 2 Byth Street Stafford QLD Australia 4053
E-mail	: kbiram@golder.com.au	E-mail	: Tom.Maloney@alsglobal.com
Telephone	: +61 07 3721 5400	Telephone	: +61-7-3243 7222
Facsimile	: +61 07 3721 5401	Facsimile	: +61-7-3243 7218
Project	: 1538021	QC Level	: NEPM 2013 B3 & ALS QC Standard
Order number	: 1538021	Date Samples Received	: 18-Dec-2015
C-O-C number	: ----	Date Analysis Commenced	: 23-Dec-2015
Sampler	: TAMARA SICCAMA	Issue Date	: 06-Jan-2016
Site	: ----	No. of samples received	: 77
Quote number	: ----	No. of samples analysed	: 54

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Gaston Allende	R&D Chemist	Sydney Organics, Smithfield, NSW
Hoa Nguyen	Senior Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Kim McCabe	Senior Inorganic Chemist	Brisbane Acid Sulphate Soils, Stafford, QLD
		Brisbane Inorganics, Stafford, QLD
Matt Frost	Senior Organic Chemist	Brisbane Organics, Stafford, QLD
Nanthini Coilparampi	Laboratory Manager - Inorganics	Sydney Inorganics, Smithfield, NSW

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR:- 0% - 50%; Result > 20 times LOR:0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB1538419**	Page	: 1 of 7
Client	: **GOLDER ASSOCIATES**	Laboratory	: Environmental Division Brisbane
Contact	: MS KRYSTLE-RAE BIRAM	Telephone	: +61-7-3243 7222
Project	: 1538021	Date Samples Received	: 18-Dec-2015
Site	: ----	Issue Date	: 06-Jan-2016
Sampler	: TAMARA SICCAMA	No. of samples received	: 77
Order number	: 1538021	No. of samples analysed	: 54

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **Laboratory Control outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Laboratory Control Spike (LCS) Recoveries							
EP068A: Organochlorine Pesticides (OC)	QC-319065-002	----	**Hexachlorobenzene (HCB)**	118-74-1	120 %	54-112%	**Recovery greater than upper control limit**
Matrix Spike (MS) Recoveries							
EG005T: Total Metals by ICP-AES	EB1538312--001	Anonymous	**Chromium**	7440-47-3	58.8 %	70-130%	**Recovery less than lower data quality objective**
EG005T: Total Metals by ICP-AES	EB1538312--001	Anonymous	**Zinc**	7440-66-6	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
ASS Field Screening Analysis	* EA037	SOIL	In house: Referenced to Acid Sulfate Soils Laboratory Methods Guidelines, version 2.1 June 2004. As received samples are tested for pH field and pH fox and assessed for a reaction rating.
Moisture Content	EA055-103	SOIL	In-house. A gravimetric procedure based on weight loss over a 12 hour drying period at 103-105 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	SOIL	(USEPA SW 846 - 8270B) Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM (2013) Schedule B(3) (Method 504,505)
TRH - Semivolatile Fraction (Silica Gel Clean Up)	EP071SG-S	SOIL	(USEPA SW 846 - 8015A) Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40.
PAH/Phenols (SIM)	EP075(SIM)	SOIL	(USEPA SW 846 - 8270B) Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 502 and 507)
TRH Volatiles/BTEX	EP080	SOIL	(USEPA SW 846 - 8260B) Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve.
Perfluorooctyl Acids and Sulfonates by LC/MS/MS	EP231	SOIL	In-House. A portion of soil is soaked in sodium hydroxide followed by extraction with methanol. The extract is neutralised with HCl and an aliquot taken to dryness, made up in mobile phase. Analysis is by LC/MSMS, ESI Negative Mode using MRM.
Perfluorinated Compounds by LCMSMS	EP231-PFC	SOIL	In-House. A portion of soil is extracted with MTBE. The extract is taken to dryness, made up in mobile phase. Analysis is by LC/MSMS, ESI Negative Mode using MRM.

Preparation Methods	Method	Matrix	Method Descriptions
Drying only	EN020D	SOIL	In House
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	(USEPA SW 846 - 5030A) 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In-house, Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Extra samples 'AM-BH20 0.5-1.0', 'AM-BH20 1.0-1.5', 'AM-BH21 0.0-0.5', 'AM-BH21 1.0-1.5', 'AM-BH22 0.0-0.5', 'AM-BH22 0.5-1.0', 'AM-BH23 0.0-0.5' and 'AM-BH23 1.0-1.5' were received. These samples will remain on hold until confirmation of analysis is received. Please contact ALS Brisbane Client Services Department to add a directive for these samples at ALSEnviro.Brisbane@alsglobal.com**
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- **PFOS/PFOA analysis will be conducted by ALS Environmental, Sydney, NATA accreditation no. 825, Site No. 10911 (Micro site no. 14913). The expected due date for this data is 11/01/2016.**
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (14 days), Solid (60 days) from date of completion of work order.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- **Sample 'QC1' is listed on the COC twice though only one sample with this name was received. It is listed both as on hold and requiring PFOS/PFOA. This sample will be kept on hold until confirmation of analysis is received.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exist.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

Matrix: **SOIL**

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Andrew Epps	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Gaston Allende	R&D Chemist	Sydney Organics, Smithfield, NSW
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.

- EG020-F (Dissolved Metals by ICP-MS): Limit of reporting raised for some samples due to matrix interference.
- PFOS and PFOA results are reported as an aggregate of linear and branched isomers.

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR:- 0% - 50%; Result > 20 times LOR:0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB1600085**	Page	: 1 of 5
Client	: **GOLDER ASSOCIATES**	Laboratory	: Environmental Division Brisbane
Contact	: MS KRYSTLE-RAE BIRAM	Telephone	: +61-7-3243 7222
Project	: 1538021	Date Samples Received	: 04-Jan-2016
Site	: ----	Issue Date	: 14-Jan-2016
Sampler	: TAMARA SICCAMA	No. of samples received	: 11
Order number	: 1538021	No. of samples analysed	: 11

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER** Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM (2013) Schedule B(3)
Acidity as Calcium Carbonate	ED038	WATER	In house: Referenced to APHA 2310 B Acidity is determined by titration with a standardised alkali to an end-point pH of 8.3. This method is compliant with NEPM (2013) Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM (2013) Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride.in the presence of ferric ions the librated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm APHA 21st edition seal method 2 017-1-L april 2003
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45 um filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
PFOS, PFOA, 6:2- and 8:2-FtS	EP231-LL	WATER	In-house: A portion of fresh or saline water is concentrated and cleaned up using a solid phase medium. Analysis by LC-Electrospray-MS-MS, Negative Mode using MRM.
Perfluorinated Compounds by LCMSMS - Low Level	EP231PFC-LL	WATER	In-house: Analysis of fresh and saline waters by solid phase extraction and LC-Electrospray-MS-MS, Negative Mode using MRM.

Client Requested Due Date	: 11-Jan-2016	Scheduled Reporting Date	: **11-Jan-2016**

Delivery Details

Mode of Delivery	: Carrier	Security Seal	: Intact.
No. of coolers/boxes	: 1	Temperature	: 1.8°C - Ice present
Receipt Detail	: MEDIUM ESKY	No. of samples received / analysed	: 11 / 11

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- **Ultra-Trace PFC analysis will be conducted by ALS Environmental, Sydney, NATA accreditation no. 825, Site No. 10911 (Micro site no. 14913). The estimated date for this data is 13/01/2016.**
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (14 days), Solid (60 days) from date of completion of work order.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exist.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ben Felgendrejeris		Brisbane Acid Sulphate Soils, Stafford, QLD

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.

- **This work order has been created to rebatch samples from previous ALS workorders EB1538408, EB1538415, EB1538419**
- ASS: EA033 (CRS Suite): ANC not required because pH KCl less than 6.5
- ASS: EA033 (CRS Suite): Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime (CaCO3) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from 'kg/t dry weight' to 'kg/m3 in-situ soil', multiply 'reported results' x 'wet bulk density of soil in t/m3'.

Order number	: 1538021	Date Samples Received	: 03-Feb-2016
C-O-C number	: ----	Date Analysis Commenced	: 09-Feb-2016
Sampler	: TAMARA SICCAMA	Issue Date	: 09-Feb-2016
Site	: Brisbane Airport	No. of samples received	: 33
Quote number	: ----	No. of samples analysed	: 33

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

NATA WORLD RECOGNISED ACCREDITATION

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out ir compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ben Felgendrejeris		Brisbane Acid Sulphate Soils, Stafford, QLD

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR:- 0% - 50%; Result > 20 times LOR:0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB1602738**	Page	: 1 of 4
Client	: **GOLDER ASSOCIATES**	Laboratory	: Environmental Division Brisbane
Contact	: MS TAMARA SICCAMA	Telephone	: +61-7-3243 7222
Project	: 1538021	Date Samples Received	: 03-Feb-2016
Site	: Brisbane Airport	Issue Date	: 09-Feb-2016
Sampler	: TAMARA SICCAMA	No. of samples received	: 33
Order number	: 1538021	No. of samples analysed	: 33

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Chromium Suite for Acid Sulphate Soils	EA033	SOIL	In house: Referenced to Ahern et al 2004. This method covers the determination of Chromium Reducible Sulfur (SCR); pHKCl; titratable actual acidity (TAA); acid neutralising capacity by back titration (ANC); and net acid soluble sulfur (SNAS) which incorporates peroxide sulfur. It applies to soils and sediments (including sands) derived from coastal regions. Liming Rate is based on results for samples as submitted and incorporates a minimum safety factor of 1.5.

Preparation Methods	Method	Matrix	Method Descriptions
Drying at 85 degrees, bagging and labelling (ASS)	EN020PR	SOIL	In house

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **This work order has been created to rebatch samples from previous ALS workorders EB1538408, EB1538415, EB1538419**
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (14 days), Solid (60 days) from date of completion of work order.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exist.**

Any sample identifications that cannot be displayed entirely in the analysis summary table will be listed below.

Subject: Rebatch of EB1538408, EB1538415 and EB1538419 (Project No.1538021)

Hi,

COC attached is a re-batch of lab references EB1538408, EB1538415 and EB1538419. Selected samples are requested for Chromium Suite Complete (EA033).

Kind regards,
Emma

SAMPLE RECEIPT NOTIFICATION (SRN)

Work Order : **EB1624693**

Client	: **GOLDER ASSOCIATES**	Laboratory	: Environmental Division Brisbane
Contact	: MS KRYSTLE-RAE BIRAM	Contact	: Carsten Emrich
Address	: P O BOX 1734 MILTON QLD, AUSTRALIA 4064	Address	: 2 Byth Street Stafford QLD Australia 4053
E-mail	: kbiram@golder.com.au	E-mail	: carsten.emrich@alsenviro.com
Telephone	: +61 07 3721 5400	Telephone	: +61 7 3243 7222
Facsimile	: +61 07 3721 5401	Facsimile	: +61-7-3243 7218
Project	: 1538021	Page	: 1 of 4
Order number	: 1538021	Quote number	: ES2016GOLASS0005 (EN/002/16)
C-O-C number	: ----	QC Level	: NEPM 2013 B3 & ALS QC Standard
Site	: Brisbane Airport		
Sampler	: MORGAN MIDGLEY		

Dates

Date Samples Received	: 14-Oct-2016 4:00 PM	Issue Date	: 17-Oct-2016
Client Requested Due Date	: 21-Oct-2016	Scheduled Reporting Date	: **21-Oct-2016**

Delivery Details

Mode of Delivery	: Carrier	Security Seal	: Intact.
No. of coolers/boxes	: 3	Temperature	: 0.1°C, 0.4°C, 1.2°C
Receipt Detail	: MEDIUM ESKIES	No. of samples received / analysed	: 74 / 73

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please be advised that sample "AM-BH26 0-0.1" was not received at the laboratory (denoted SNR on the scanned COC).**
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- **PFAS analysis will be conducted by ALS Environmental, Sydney, NATA accreditation no. 825, Site No. 10911 (Micro site no. 14913).**
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (14 days), Solid (60 days) from date of completion of work order.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default to 15:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory for processing purposes and will be shown bracketed without a time component.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alex Rossi	Organic Chemist	Sydney Organics, Smithfield, NSW
Andrew Epps	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Ben Felgendrejeris		Brisbane Acid Sulphate Soils, Stafford, QLD
Matt Frost	Senior Organic Chemist	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EG005T (Total Metals): Sample EB1624693-002 shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- ASS: EA037 (Rapid Field and F(ox) screening): pH F(ox) Reaction Rate: 1 - Slight; 2 - Moderate; 3 - Strong; 4 - Extreme
- EA037 ASS Field Screening: NATA accreditation does not cover performance of this service.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.

Contact	: MS KRYSTLE-RAE BIRAM	Contact	: Carsten Emrich
Address	: P O BOX 1734 MILTON QLD, AUSTRALIA 4064	Address	: 2 Byth Street Stafford QLD Australia 4053
Telephone	: +61 07 3721 5400	Telephone	: +61 7 3243 7222
Project	: 1538021	Date Samples Received	: 14-Oct-2016
Order number	: 1538021	Date Analysis Commenced	: 18-Oct-2016
C-O-C number	: ----	Issue Date	: 21-Oct-2016
Sampler	: MORGAN MIDGLEY		
Site	: Brisbane Airport		
Quote number	: ----		
No. of samples received	: 74		
No. of samples analysed	: 73		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alex Rossi	Organic Chemist	Sydney Organics, Smithfield, NSW
Andrew Epps	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Ben Felgendrejeris		Brisbane Acid Sulphate Soils, Stafford, QLD
Matt Frost	Senior Organic Chemist	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB1624693**	Page	: 1 of 9
Client	: **GOLDER ASSOCIATES**	Laboratory	: Environmental Division Brisbane
Contact	: MS KRYSTLE-RAE BIRAM	Telephone	: +61 7 3243 7222
Project	: 1538021	Date Samples Received	: 14-Oct-2016
Site	: Brisbane Airport	Issue Date	: 21-Oct-2016
Sampler	: MORGAN MIDGLEY	No. of samples received	: 74
Order number	: 1538021	No. of samples analysed	: 73

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Duplicate (DUP) RPDs							
EG005T: Total Metals by ICP-AES	EB1624693--002	AM-BH26 0.25-0.5	**Chromium**	7440-47-3	22.2 %	0% - 20%	**RPD exceeds LOR based limits**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
ASS Field Screening Analysis	* EA037	SOIL	In house: Referenced to Acid Sulfate Soils Laboratory Methods Guidelines, version 2.1 June 2004. As received samples are tested for pH field and pH fox and assessed for a reaction rating.
Moisture Content	EA055-103	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 103-105 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3)
Total Metals by ICP-MS - Suite R	EG020R-T	SOIL	In house: Referenced to APHA 3125; USEPA SW846 - 6020. Metals in solids are determined following an appropriate acid digestion. The ICPMS technique ionizes selected elements. Ions are passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass / charge ratios prior to measurement by a discrete dynode ion detector. This method is compliant with NEPM (2013) Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270D Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM (2013) Schedule B(3) (Method 504,505)
TRH - Semivolatile Fraction (Silica Gel Clean Up)	EP071SG-S	SOIL	In house: Referenced to USEPA SW 846 - 8015A Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40.
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270D Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 502 and 507)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260B Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-House. A portion of soil is extracted with MTBE. The extract is taken to dryness, made up in mobile phase. Analysis is by LC/MSMS, ESI Negative Mode using MRM. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers.

Preparation Methods	Method	Matrix	Method Descriptions
Drying only	EN020D	SOIL	In house
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM (2013) Schedule B(3) (Method 202)

Preparation Methods	Method	Matrix	Method Descriptions
Sample Extraction for PFAS	EP231-PR	SOIL	In house
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.

No. of coolers/boxes	: 3	Temperature	: 1.5, 1.2, 1.7°C
Receipt Detail	: MEDIUM ESKIES	No. of samples received / analysed	: 90 / 85

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **As only a soil jar suitable for PFAS testing was received for "AM-BH30 2.75-3" (ALS #78), pH Field and Fox (EA037) will not be tested on this sample.**
- **Samples "QAQC006" and "QAQC002" will be forwarded to Eurofins, as requested.**
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- **PFAS analysis will be conducted by ALS Environmental, Sydney, NATA accreditation no. 825, Site No. 10911 (Micro site no. 14913). The estimated due date for this data is the 25/10/16.**
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (14 days), Solid (60 days) from date of completion of work order.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Please be advised that a soil jar for PFAS testing was not received for "AM-BH14 1-1.25" (ALS #17), however one was received for "AM-BH14 0.75-1" (ALS #16). PFAS testing has been assigned to ALS #16, however if testing for this is not required on this sample, please contact ALS Client Services at ALSEnviro.Brisbane@alsglobal.com , ASAP.**
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default to 15:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory for processing purposes and will be shown bracketed without a time component.

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Andrew Epps	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Ben Felgendrejeris		Brisbane Acid Sulphate Soils, Stafford, QLD
Lana Nguyen	Senior LCMS Chemist	Sydney Organics, Smithfield, NSW
Matt Frost	Senior Organic Chemist	Brisbane Inorganics, Stafford, QLD
Matt Frost	Senior Organic Chemist	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EG005T (Total Metals): Sample EB1624685-033 shows poor matrix spike recovery due to sample heterogeneity. Confirmed by visual inspection.
- EG035T (Total Mercury): Sample EB1624685-033 shows poor spike recovery due to sample heterogeneity. Confirmed by visual inspection
- EP068 Pesticides: Sample 'AM-BH14 0.25-0.5' shows poor matrix spike recovery for 4,4/ due to matrix interference. Confirmed by re-extraction and re-analysis.
- EP068 Pesticides: High LCS recovery deemed acceptable as all associated analyte results are less than LOR.
- EP075(SIM): High LCS recovery deemed acceptable as all associated analyte results are less than LOR.
- ASS: EA037 (Rapid Field and F(ox) screening): pH F(ox) Reaction Rate: 1 - Slight; 2 - Moderate; 3 - Strong; 4 - Extreme
- EA037 ASS Field Screening: NATA accreditation does not cover performance of this service.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.

Project	: 1538021	Date Samples Received	: 14-Oct-2016
Order number	: 1538021	Date Analysis Commenced	: 18-Oct-2016
C-O-C number	: ----	Issue Date	: 25-Oct-2016
Sampler	: MORGAN MIDGLEY		
Site	: Brisbane Airport		
Quote number	: ----		
No. of samples received	: 90		
No. of samples analysed	: 85		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Andrew Epps	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Ben Felgendrejeris		Brisbane Acid Sulphate Soils, Stafford, QLD
Lana Nguyen	Senior LCMS Chemist	Sydney Organics, Smithfield, NSW
Matt Frost	Senior Organic Chemist	Brisbane Inorganics, Stafford, QLD
Matt Frost	Senior Organic Chemist	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB1624749**	Page	: 1 of 13
Client	: **GOLDER ASSOCIATES**	Laboratory	: Environmental Division Brisbane
Contact	: MS KRYSTLE-RAE BIRAM	Telephone	: +61 7 3243 7222
Project	: 1538021	Date Samples Received	: 14-Oct-2016
Site	: Brisbane Airport	Issue Date	: 25-Oct-2016
Sampler	: MORGAN MIDGLEY	No. of samples received	: 90
Order number	: 1538021	No. of samples analysed	: 85

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **Laboratory Control outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Laboratory Control Spike (LCS) Recoveries							
EP068A: Organochlorine Pesticides (OC)	QC-620755-002	----	**Hexachlorobenzene (HCB)**	118-74-1	114 %	54-112%	**Recovery greater than upper control limit**
EP068B: Organophosphorus Pesticides (OP)	QC-620755-002	----	**Pirimphos-ethyl**	23505-41-1	131 %	70-130%	**Recovery greater than upper control limit**
EP068B: Organophosphorus Pesticides (OP)	QC-620755-002	----	**Carbophenothion**	786-19-6	126 %	57-124%	**Recovery greater than upper control limit**
EP075(SIM)B: Polynuclear Aromatic Hydrocarbons	QC-620753-002	----	**Anthracene**	120-12-7	122 %	72-115%	**Recovery greater than upper control limit**
EP075(SIM)B: Polynuclear Aromatic Hydrocarbons	QC-620753-002	----	**Fluoranthene**	206-44-0	127 %	70-116%	**Recovery greater than upper control limit**
EP075(SIM)B: Polynuclear Aromatic Hydrocarbons	QC-620753-002	----	**Chrysene**	218-01-9	125 %	66-119%	**Recovery greater than upper control limit**
Matrix Spike (MS) Recoveries							
EG005T: Total Metals by ICP-AES	EB1624685--033	Anonymous	**Arsenic**	7440-38-2	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EG005T: Total Metals by ICP-AES	EB1624685--033	Anonymous	**Chromium**	7440-47-3	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EG005T: Total Metals by ICP-AES	EB1624685--033	Anonymous	**Copper**	7440-50-8	9.19 %	70-130%	**Recovery less than lower data quality objective**
EG005T: Total Metals by ICP-AES	EB1624685--033	Anonymous	**Zinc**	7440-66-6	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EG035T: Total Recoverable Mercury by FIMS	EB1624685--033	Anonymous	**Mercury**	7439-97-6	139 %	70-130%	**Recovery greater than upper data quality objective**
EP068A: Organochlorine Pesticides (OC)	EB1624749--014	AM-BH14 0.25-0.5	**4.4`-DDT**	50-29-3	57.7 %	70-130%	**Recovery less than lower data quality objective**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
ASS Field Screening Analysis	* EA037	SOIL	In house: Referenced to Acid Sulfate Soils Laboratory Methods Guidelines, version 2.1 June 2004. As received samples are tested for pH field and pH fox and assessed for a reaction rating.
Moisture Content	EA055-103	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 103-105 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3)
Total Metals by ICP-MS - Suite R	EG020R-T	SOIL	In house: Referenced to APHA 3125; USEPA SW846 - 6020. Metals in solids are determined following an appropriate acid digestion. The ICPMS technique ionizes selected elements. Ions are passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass / charge ratios prior to measurement by a discrete dynode ion detector. This method is compliant with NEPM (2013) Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270D Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM (2013) Schedule B(3) (Method 504,505)
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015A Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40.
TRH - Semivolatile Fraction (Silica Gel Clean Up)	EP071SG-S	SOIL	In house: Referenced to USEPA SW 846 - 8015A Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40.
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270D Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 502 and 507)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260B Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-House. A portion of soil is extracted with MTBE. The extract is taken to dryness, made up in mobile phase. Analysis is by LC/MSMS, ESI Negative Mode using MRM. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers.

Preparation Methods	Method	Matrix	Method Descriptions
Drying only	EN020D	SOIL	In house

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM (2013) Schedule B(3) (Method 202)
Sample Extraction for PFAS	EP231-PR	SOIL	In house
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.

Signatories	*Position*	*Accreditation Category*
Ben Felgendrejeris		Brisbane Acid Sulphate Soils, Stafford, QLD

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- **The samples in this work order have been re-batched from EB1624693.**
- ASS: EA033 (CRS Suite): Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime (CaCO3) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from 'kg/t dry weight' to 'kg/m3 in-situ soil', multiply 'reported results' x 'wet bulk density of soil in t/m3'.

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB1625883**	Page	: 1 of 5
Client	: **GOLDER ASSOCIATES**	Laboratory	: Environmental Division Brisbane
Contact	: MS KRYSTLE-RAE BIRAM	Telephone	: +61 7 3243 7222
Project	: 1538021	Date Samples Received	: 28-Oct-2016
Site	: Brisbane Airport	Issue Date	: 03-Nov-2016
Sampler	: MORGAN MIDGLEY	No. of samples received	: 18
Order number	: 1538021	No. of samples analysed	: 18

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Chromium Suite for Acid Sulphate Soils	EA033	SOIL	In house: Referenced to Ahern et al 2004. This method covers the determination of Chromium Reducible Sulfur (SCR); pHKCl; titratable actual acidity (TAA); acid neutralising capacity by back titration (ANC); and net acid soluble sulfur (SNAS) which incorporates peroxide sulfur. It applies to soils and sediments (including sands) derived from coastal regions. Liming Rate is based on results for samples as submitted and incorporates a minimum safety factor of 1.5.

Preparation Methods	Method	Matrix	Method Descriptions
Drying at 85 degrees, bagging and labelling (ASS)	EN020PR	SOIL	In house

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **The samples in this work order have been re-batched from EB1624749.**
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (14 days), Solid (60 days) from date of completion of work order.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default to 15:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory for processing purposes and will be shown bracketed without a time component.

Project	: 1538021	Date Samples Received	: 28-Oct-2016 15:00
Order number	: 1538021	Date Analysis Commenced	: 02-Nov-2016
C-O-C number	: ----	Issue Date	: 02-Nov-2016 16:46
Sampler	: MORGAN MIDGLEY		
Site	: Brisbane Airport		
Quote number	: ----		
No. of samples received	: 21		
No. of samples analysed	: 21		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ben Felgendrejeris		Brisbane Acid Sulphate Soils, Stafford, QLD

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- **The samples in this work order have been re-batched from EB1624749.**
- Amendment (02/11/2016): This report has been amended and re-released to allow adjustment of the LCS amount added value for TAA. New LCS was used with old LCS amount added value, causing Standard to appear to fail. All analysis results are as per the previous report.
- ASS: EA033 (CRS Suite): Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime (CaCO3) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from 'kg/t dry weight' to 'kg/m3 in-situ soil', multiply 'reported results' x 'wet bulk density of soil in t/m3'.

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB1625888**	Page	: 1 of 6
Amendment	: **1**		
Client	: **GOLDER ASSOCIATES**	Laboratory	: Environmental Division Brisbane
Contact	: MS KRYSTLE-RAE BIRAM	Telephone	: +61 7 3243 7222
Project	: 1538021	Date Samples Received	: 28-Oct-2016
Site	: Brisbane Airport	Issue Date	: 02-Nov-2016
Sampler	: MORGAN MIDGLEY	No. of samples received	: 21
Order number	: 1538021	No. of samples analysed	: 21

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Chromium Suite for Acid Sulphate Soils	EA033	SOIL	In house: Referenced to Ahern et al 2004. This method covers the determination of Chromium Reducible Sulfur (SCR); pHKCl; titratable actual acidity (TAA); acid neutralising capacity by back titration (ANC); and net acid soluble sulfur (SNAS) which incorporates peroxide sulfur. It applies to soils and sediments (including sands) derived from coastal regions. Liming Rate is based on results for samples as submitted and incorporates a minimum safety factor of 1.5.

Preparation Methods	Method	Matrix	Method Descriptions
Drying at 85 degrees, bagging and labelling (ASS)	EN020PR	SOIL	In house

Dates

Date Samples Received	: 25-Oct-2016 3:15 PM	Issue Date	: 25-Oct-2016
Client Requested Due Date	: 01-Nov-2016	Scheduled Reporting Date	: **01-Nov-2016**

Delivery Details

Mode of Delivery	: Client Drop Off	Security Seal	: Intact.
No. of coolers/boxes	: 2	Temperature	: 5.4°C, 5.8°C - Ice present
Receipt Detail	: MEDIUM ESKIES	No. of samples received / analysed	: 12 / 12

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- **PFAS analysis will be conducted by ALS Environmental, Sydney, NATA accreditation no. 825, Site No. 10911 (Micro site no. 14913).**
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (14 days), Solid (60 days) from date of completion of work order.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

Method *Client sample ID*	Sample Container Received	Preferred Sample Container for Analysis
Dissolved Mercury by FIMS : EG035F		
QAQC300	- Clear Plastic Bottle - Natural	- Clear Plastic Bottle - Nitric Acid; Filtered
Dissolved Metals by ICP-MS - Suite A : EG020A-F		
QAQC300	- Clear Plastic Bottle - Natural	- Clear Plastic Bottle - Nitric Acid; Filtered

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default to 15:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory for processing purposes and will be shown bracketed without a time component.

QUALITY CONTROL REPORT

Work Order	: **EB1625464**	Page	: 1 of 9
Client	: **GOLDER ASSOCIATES**	Laboratory	: Environmental Division Brisbane
Contact	: K BIRAM	Contact	: Carsten Emrich
Address	: P O BOX 1734 MILTON QLD, AUSTRALIA 4064	Address	: 2 Byth Street Stafford QLD Australia 4053
Telephone	: +61 07 3721 5400	Telephone	: +61 7 3243 7222
Project	: 1538021	Date Samples Received	: 25-Oct-2016
Order number	: 1538021	Date Analysis Commenced	: 27-Oct-2016
C-O-C number	: ----	Issue Date	: 01-Nov-2016
Sampler	: MORGAN MIDGLEY		
Site	: Brisbane Airport		
Quote number	: ----		
No. of samples received	: 12		
No. of samples analysed	: 12		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alex Rossi	Organic Chemist	Sydney Organics, Smithfield, NSW
Greg Vogel	Laboratory Manager	Brisbane Inorganics, Stafford, QLD
Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **WATER**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **WATER**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB1625464**	Page	: 1 of 8
Client	: **GOLDER ASSOCIATES**	Laboratory	: Environmental Division Brisbane
Contact	: K BIRAM	Telephone	: +61 7 3243 7222
Project	: 1538021	Date Samples Received	: 25-Oct-2016
Site	: Brisbane Airport	Issue Date	: 01-Nov-2016
Sampler	: MORGAN MIDGLEY	No. of samples received	: 12
Order number	: 1538021	No. of samples analysed	: 12

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
pH by PC Titrator	EA005-P	WATER	In house: Referenced to APHA 4500 H+ B. This procedure determines pH of water samples by automated ISE. This method is compliant with NEPM (2013) Schedule B(3)
Conductivity by PC Titrator	EA010-P	WATER	In house: Referenced to APHA 2510 B. This procedure determines conductivity by automated ISE. This method is compliant with NEPM (2013) Schedule B(3)
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM (2013) Schedule B(3)
Acidity as Calcium Carbonate	ED038	WATER	In house: Referenced to APHA 2310 B Acidity is determined by titration with a standardised alkali to an end-point pH of 8.3. This method is compliant with NEPM (2013) Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM (2013) Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride.in the presence of ferric ions the librated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm APHA 21st edition seal method 2 017-1-L april 2003
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM (2013) Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM (2013) Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM (2013) Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM (2013) Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS by LCMSMS	EP231X-LL	WATER	In-house: Analysis of fresh and saline waters by solid phase extraction followed by and LC-Electrospray-MS-MS, Negative Mode using MRM. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers.

Preparation Methods	Method	Matrix	Method Descriptions

Kim McCabe	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EG020-F (Dissolved Metals): LOR's have been raised for some samples due to matrix interference.

APPENDIX D

Important Information Relating to this Report

IMPORTANT INFORMATION RELATING TO THIS REPORT

The document ("Report") to which this page is attached and which this page forms a part of, has been issued by Golder Associates Pty Ltd ("Golder") subject to the important limitations and other qualifications set out below.

This Report constitutes or is part of services ("Services") provided by Golder to its client ("Client") under and subject to a contract between Golder and its Client ("Contract"). The contents of this page are not intended to and do not alter Golder's obligations (including any limits on those obligations) to its Client under the Contract.

This Report is provided for use solely by Golder's Client and persons acting on the Client's behalf, such as its professional advisers. Golder is responsible only to its Client for this Report. Golder has no responsibility to any other person who relies or makes decisions based upon this Report or who makes any other use of this Report. Golder accepts no responsibility for any loss or damage suffered by any person other than its Client as a result of any reliance upon any part of this Report, decisions made based upon this Report or any other use of it.

This Report has been prepared in the context of the circumstances and purposes referred to in, or derived from, the Contract and Golder accepts no responsibility for use of the Report, in whole or in part, in any other context or circumstance or for any other purpose.

The scope of Golder's Services and the period of time they relate to are determined by the Contract and are subject to restrictions and limitations set out in the Contract. If a service or other work is not expressly referred to in this Report, do not assume that it has been provided or performed. If a matter is not addressed in this Report, do not assume that any determination has been made by Golder in regards to it.

At any location relevant to the Services conditions may exist which were not detected by Golder, in particular due to the specific scope of the investigation Golder has been engaged to undertake. Conditions can only be verified at the exact location of any tests undertaken. Variations in conditions may occur between tested locations and there may be conditions which have not been revealed by the investigation and which have not therefore been taken into account in this Report.

Golder accepts no responsibility for and makes no representation as to the accuracy or completeness of the information provided to it by or on behalf of the Client or sourced from any third party. Golder has assumed that such information is correct unless otherwise stated and no responsibility is accepted by Golder for incomplete or inaccurate data supplied by its Client or any other person for whom Golder is not responsible. Golder has not taken account of matters that may have existed when the Report was prepared but which were only later disclosed to Golder.

Having regard to the matters referred to in the previous paragraphs on this page in particular, carrying out the Services has allowed Golder to form no more than an opinion as to the actual conditions at any relevant location. That opinion is necessarily constrained by the extent of the information collected by Golder or otherwise made available to Golder. Further, the passage of time may affect the accuracy, applicability or usefulness of the opinions, assessments or other information in this Report. This Report is based upon the information and other circumstances that existed and were known to Golder when the Services were performed and this Report was prepared. Golder has not considered the effect of any possible future developments including physical changes to any relevant location or changes to any laws or regulations relevant to such location.

Where permitted by the Contract, Golder may have retained subconsultants affiliated with Golder to provide some or all of the Services. However, it is Golder which remains solely responsible for the Services and there is no legal recourse against any of Golder's affiliated companies or the employees, officers or directors of any of them.

By date, or revision, the Report supersedes any prior report or other document issued by Golder dealing with any matter that is addressed in the Report.

Any uncertainty as to the extent to which this Report can be used or relied upon in any respect should be referred to Golder for clarification.

As a global, employee-owned organisation with over 50 years of experience, Golder Associates is driven by our purpose to engineer earth's development while preserving earth's integrity. We deliver solutions that help our clients achieve their sustainable development goals by providing a wide range of independent consulting, design and construction services in our specialist areas of earth, environment and energy.

FIGURES

APPENDICES

1.0 INTRODUCTION

Brisbane Airport Corporation Pty Ltd (BAC) commissioned Golder Associates Pty Ltd (Golder) to undertake an Acid Sulfate Soil (ASS) assessment for Stage 2 of the Auto Mall Precinct project at the Brisbane Airport (see Figure 1). Golder has previously conducted an acid sulfate soil investigation for Stage 1of the Auto Mall Precinct for BAC (reference 1538021-005-R-RevA, February 2016). The purpose of the current assessment is to inform the detailed design of the proposed development.

The ASS investigation was undertaken during October 2016 as part of a combined geotechnical, contamination and ASS investigation and is based on the scope of work defined in our proposal (Golder document reference no. P1538021-005-P-Rev0 dated 5 September 2016).

This report presents the ASS assessment findings for Stage 2 of the Auto Mall Precinct. The assessment results from the geotechnical and contamination investigation are provided in separate reports.

2.0 PROJECT DETAILS

An Auto Mall Precinct is proposed to be developed on an area between Moreton Drive, Nancy Bird Way and Airport Drive at the Brisbane Airport. Refer attached **Figure 1** for the location plan. The proposed development comprises a test track in the middle of the site, surrounded by development lots for future commercial use. Private roads are located around the perimeter of the site. An Energex substation and easement is present on the site.

At the time of writing, we understand that the site is to be developed in three stages as follows:

- Development Stage 1: Track, roads and selected development lots; lots north of the Energex easement between the track and Moreton Drive, and the Track and Nancy Bird Way.
- Development Stage 2: development lots south of the Energex easement.
- Development Stage 3: development lots north of the Energex easement between the track and Airport Drive.

Drainage channels will run along site perimeter, with invert levels as low as of RL 0.2 m AD in the western portion of the site. Site drainage channels will discharge into nearby surface water drains

The current staging plan is provided in **Appendix A**.

However, for consistency with previous works, we refer to the portion of the site north of the Energex easement as Stage 1, and the portion to the south as Stage 2. This report focusses on Stage 2 investigation results (hereinafter referred to as “the site”).

3.0 SITE DESCRIPTION

The site has an average existing surface level of about 2.4 m AD[1] and is currently heavily vegetated with casuarina forest and mangroves. Stage 2 of the development covers an area of approximately 500 m by 300 m.

Landers Pocket drain is the closet surface water body feature located at least 100m west of the project area. Surface water in Landers Pocket drain flows north east for about 1km from the site before discharging into Kedron Brook Floodway Drain. The Kedron Brook Floodway Drain discharges into Kedron Brook. The ultimate receiving environment of surface water from Kedron Brook is Moreton Bay. Proposed surface water drains will discharge into Landers Pocket drain.

[1] Aerodrome Datum

4.0 BACKGROUND INFORMATION

4.1 About Acid Sulfate Soils

Pyritic soils or ASS, were deposited in coastal zones throughout the world during the last 6,500 to 10,000 years. When drained for development or otherwise disturbed, the iron pyrite in these sediments oxidises producing sulfuric acid which subsequently lowers the pH in runoff and groundwater, leading to the release of toxic aluminium and iron from the sediments.

The formation of ASS is commonly the result of marine or estuarine deposition of sulfate and iron bearing sediments in the presence of an abundant source of readily decomposable organic matter resulting in the deposition of pyrite. This pyrite is stable within the soil so long as anoxic conditions prevail. Oxidation of this material produces acidic conditions, a process that typically occurs when the material is exposed to air, such as when raised above the water table by excavation, or by lowering the water table during dewatering processes. This can occur as a result of natural processes, for example as a result of fluctuations in the seawater level.

Acidic water introduced into coastal streams can cause fish kills, alterations to ecosystems and corrosion of civil structures. The source of the acid is naturally occurring pyrite. Environmental degradation occurs when this pyrite oxidises and sulfuric acid is produced and discharged into receiving waters. If receiving water in ASS areas is naturally saline, low level acidity naturally generated is often adequately buffered by the salinity and sometimes by the presence of alkaline calcareous materials present within the alluvial deposits.

Previous experience and available guidelines indicate that ASS are normally restricted in extent to recent (Holocene age) soil horizons deposited in a saline environment below RL 5 m AHD, with Actual ASS (AASS) often occurring at the top of the soil profile, being underlain by Potential ASS (PASS). ASS commonly occurs throughout lowland coastal areas of Australia.

4.2 Previous Investigations

Golder previously conducted a desktop assessment of ASS, groundwater and contamination for the Auto Mall Precinct in 2014 (reference 1460490-002-R-Rev0, February 2015) and an acid sulfate soil investigation for Stage 1of the Auto Mall Precinct for BAC (reference 1538021-005-R-RevA, February 2016). The findings of this desktop assessment and acid sulfate soil investigation indicated the following:

1460490-002-R-Rev0

- Sub-surface conditions typically comprise:

  Crust – A clay ‘crust’ layer up to 1.0 m bgl is present in some areas due to desiccation.

  Younger Alluvium (Holocene) – Highly compressible, inter-bedded sandy clays and clayey sands (Upper Holocene) and silty clays (Lower Holocene) extending to depths up to 30 m below ground level in places.

- Shallow surface fill may be present on the edges of the site with depths ranging from 0.15m to 1.1m. The fill was a mix of silts and sandy clays with some sands. The underlying natural profiles (upper Holocene alluvium) comprised variable light, medium and heavy clays and clayey sands, with some thin layers of peat and ‘clean’ sands. The natural soils were generally grey to dark grey and dark brown, indicative of ASS.
- Field screening and laboratory analysis of site soils indicated the presence of actual acid sulfate soils (AASS) typically from the surface to depth of about 0.6m to 1.1 m AHD underlain by potential acid sulfate soils (PASS) to depths of more than 1.2 m AHD (the limit of previous ASS investigations).
- The acid neutralising capacity (ANC) of the alluvium is generally not adequate to naturally buffer the actual and potential acidity produced.
- Net acidity in the AASS materials ranged from 0.08 S% to about 1.94 S%. Net acidity in the PASS materials ranged from 0.06 S% to about 2.55 S%.

- Investigation of the Stage 1 area indicated that AASS materials are present from the ground surface to levels about 0.8m AD and 1.2m AD and deeper in isolated pockets where previous localised ground disturbances may have occurred. AASS was detected in materials below the water table which indicated that the groundwater table had been historically lowered in this area. Calculated liming rates to neutralise net acidity in the identified AASS materials range from about 5 kg/m^3 to 30 kg/m^3.
- PASS materials underlie the AASS materials across the site. Net Acidity in PASS materials varied considerably across the Stage 1 area. Calculated liming rates to neutralise net acidity in the identified PASS materials towards the northern and southern ends of Stage 1 ranged from about 15 kg/m^3 to 60 kg/m^3. Through the centre of the Stage 1 area much higher net acidity was indicated with liming rates generally ranging from about 90 kg/m^3 to 150 kg/m^3 and as high as 320 kg/m^3 in one sample.
- Groundwater samples suggested a variable or historically disturbed environment. The groundwater had suitable available buffering capacity to maintain an acceptable pH level in the presence of minor acid generation at the northern end of Stage 1. However, groundwater samples from the remainder of the site indicated a buffering capacity inadequate to maintain stable, acceptable pH level in areas vulnerable to acidification. Acid conditions and aluminium concentrations above the Airports (Environmental Protection) Regulations accepted limit were detected in two groundwater samples.

4.3 Geology

Reference to the Geological Survey of Queensland 1:100,000 scale Brisbane Geological map (1990) indicates that all of the assessment site is located on alluvial deposits of Holocene age.

Holocene deposits are typically associated with ASS formation.

4.4 Hydrogeology

Previous investigations in this area (Stage 1 Investigation) encountered groundwater levels ranging from about 1.3m AD to 2.1m AD with a general direction of groundwater flow inferred as west towards Landers Pocket Drain.

4.5 Soil Landscape

The “Soil Landscapes of Brisbane and South-Eastern Environs, Queensland”, CSIRO 1:100,000 scale Map Sheet (1985) indicates that the assessment site is situated within an alluvial landscape likely to comprise the following soil group:

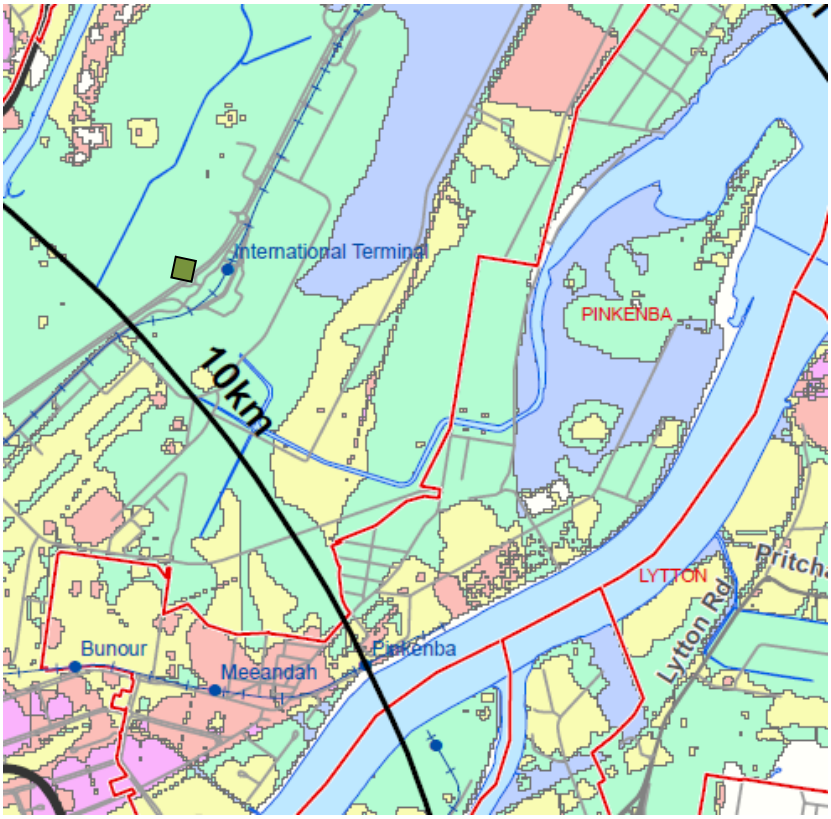
Woongoolba- WO

- Dominant Soil Group – ‘Humic gleys, peaty gleys’ and ‘solonchaks’
- Landscape and Parent Geology – Low (coastal) plains of alluvium and narrow depressions.

This soil profile is a young alluvium that frequently contains moderate to high concentrations of pyritic material and fine organic matter. This soil unit is generally associated with ASS.

4.6 ASS Risk Maps

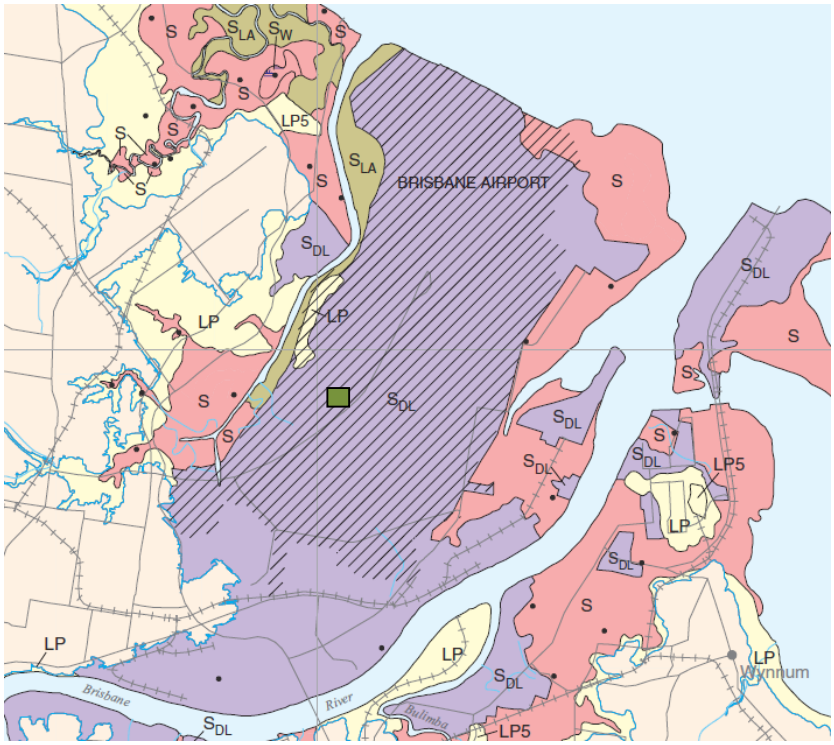
The Brisbane City Council “A Guide to the Likely Location of Acid Sulfate Soils in Brisbane” 1:50,000 scale risk map, indicates that the site is situated in an area mapped as having a ‘Very High’ risk of encountering ASS (refer below). The ‘Very High’ risk ASS soils at the site are likely to be associated with the recent alluvial soils.



ACID SULPHATE SOILS
HAZARD_RATING
- Extremely High
- Very High
- High
- Medium
- Low

Approximate location of site

Brisbane City Council ASS Hazard Risk Map for the Site



Approximate location of site

DNRM Acid Sulfate Soils Map for the Site

The Department of Natural Resources Mines (DNRM), 1:100,000 scale Map 1 "Acid Sulfate Soils –Tweed Heads to Redcliffe" (refer above), indicates that the site is situated in an area mapped as:

- SDL – Disturbed land (e.g. canal estates, marinas, aquaculture, quarry, urban, and industrial likely to contain ASS. (In some cases, partial or full treatment may have been undertaken). Limited field investigation.

5.0 REGULATORY FRAMEWORK

The following key regulatory drivers and guidance documents have been considered and utilised in conducting this assessment:

- *Guidelines for Sampling and Analysis of Lowland Acid Sulfate Soils in Queensland – 1998.* QASSIT
- *Queensland Acid Sulfate Soil Technical Manual: Soil Management Guidelines*. 2014. Department of Science, Information Technology, Innovation and the Arts, Queensland Government.

6.0 FIELDWORK

6.1 Soil Investigation

Details of the soil investigation methodology for the ASS investigation is summarised in Table 1 below.

Table 1: Field Activities - Drilling and Soil Sampling

Activity	Details
Drilling	Soil sampling for the acid sulfate soil assessment was conducted on 6 and 7 October 2016. The sampling was conducted in conjunction with contamination and geotechnical investigations for the site. ASS investigations included 10 boreholes identified as AM-BH10, AM-BH13, AM-BH14, AM-BH15, AM-BH16, AM-BH18, AM-BH24, AM-BH25, AM-BH26 and AM-BH29. The boreholes were advanced by a light tracked drilling rig to depths between 2.8 m and 3 m using hollow stem augers. Borehole drilling was carried out under the supervision of a geotechnical engineer from Golder. Soil descriptions for the lithology encountered during drilling are presented as borehole logs in Appendix A.
Borehole Survey	Upon completion of intrusive investigations selected locations were surveyed by MPA Surveyors on 14 October 2016 using differential GPS for easting, northing and RL.
Soil Sampling	Soil samples were collected at 0.25 m intervals from the surface to about 3 m below ground level (bgl) for ASS testing.
Samples Preservation and Handling	All ASS samples were labelled and sealed in plastic bags and refrigerated, then frozen within 24 hours, until laboratory testing was undertaken. All samples collected were sent to Australian Laboratory Services (ALS) of Brisbane under Chain of Custody (CoC) procedure (documents in Appendix B).
Soil Screening	All soil samples were screened using the pH_F/pH_{FOX} test method.
Soil Analysis	Soil samples were selected on the basis of the screening test results for quantitative laboratory analyses by the Chromium Suite test method (laboratory documents in Appendix B).

6.2 Groundwater Investigation

Details of groundwater investigation methodology are summarised in Table 2 below.

Table 2: Field Activities - Groundwater Well Installation and Sampling

Activity	Details
Monitoring Well Installation and Construction	Four boreholes (AM-BH10, AM-BH14, AM-BH15 and AM-BH16) were converted into new groundwater monitoring wells. Figure 1 displays the new monitoring well locations and existing wells installed around the site during previous investigations. New monitoring wells were constructed using 50 mm, Class 18 PVC threaded screen and casing. Construction details for monitoring wells are presented on borehole reports in Appendix A.
Well Development	Following installation the new wells were developed using a dedicated disposable bailer.
Well Gauging	Standing water levels (SWLs) were measured in new and selected existing wells on 25 October 2016 prior to sampling using a calibrated water level meter. Groundwater gauging data are presented in Section 8.2 Table 5.
Well Purging	The wells were sampled using low flow sampling methods and therefore purging was not required. Groundwater quality parameters and visual observations were recorded during purging. Purging continued until three well volumes were removed.
Groundwater Sampling	Groundwater samples were collected from all wells using low flow sampling and collection techniques.
Sample Preservation and Handling	Collected water samples were placed in laboratory supplied containers. Samples were placed with ice, in eskies whilst on-site and in transit to the laboratory. All samples were sent to Australian Laboratory Services (ALS) of Brisbane under Chain of Custody (CoC) procedures (documents in Appendix B).
Groundwater Analysis	Groundwater samples were analysed for ASS indicator parameters comprising pH, electrical conductivity, chloride, sulfate, alkalinity, acidity, dissolved iron, dissolved aluminium and total iron. Laboratory analytical reports are presented in Appendix B.

7.0 ASSESSMENT CRITERIA

Table 3 below shows the ASS action levels adopted in Queensland. These categories are used to identify whether action / management of ASS disturbances is required, based on 'net acidity' (derived from the results of the Chromium Suite analysis or the Chromium Suite test suites). For this assessment an action criteria of 0.03% Equivalent Sulfur has been adopted.

Table 3: ASS Action Criteria

Type of Material		Action Criteria 1-1000 tonnes disturbed		Action Criteria > 1000 tonnes disturbed (and major fill projects)	
		Existing + Potential Acidity		Existing + Potential Acidity	
Texture range McDonald et al. (1990)	**Approx. clay content (%)**	**Equivalent sulfur %S oxidisable**	**Equivalent acid mol H^+/ tonne**	**Equivalent sulfur %S oxidisable (oven-dry basis)**	**Equivalent acid mol H^+/ tonne (oven-dry basis)**
Coarse Texture Sands to loamy sands	≤5	0.03	18	0.03	18*
Medium Texture Sandy loams to light clays	5 – 40	0.06	36	0.03	18*
Fine Texture Medium to heavy clays and silty clays	≥40	0.10	62	0.03	18*

Table 4 below (*Treatment and management of soils and water in acid sulfate soil landscapes*, July 2011, revised 2015, WA DEC) provides a guide for the assessment of the buffering capacity of groundwater.

Table 4: General Indicators for Buffering Capacity

Class	Designation	Alkalinity		pH	Description
		mg/L	meq./L		
1	Very high alkalinity	>180	>3	>6.5	Adequate to maintain acceptable pH level in the future.
2	High alkalinity	60-80	1-3	>6.0	Adequate to maintain acceptable pH level in the future.
3	Moderate alkalinity	30-60	0.5-1.0	5.5-7.5	Inadequate to maintain stable, acceptable pH level in areas vulnerable to acidification.
4	Low alkalinity	10-30	0.2-0.5	5.0-6.0	Inadequate to maintain stable, acceptable pH level.
5	Very low alkalinity	<10	<0.2	<6.0	Unacceptable pH level under all circumstances.

8.0 INVESTIGATION FINDINGS

8.1 Subsurface Conditions

Detailed information of subsurface conditions encountered at the site are described in Borehole Logs (Appendix A).

A summary of typical subsurface conditions encountered is as follows:

- **Crust** – A desiccated layer generally comprising loose silty sand and sandy clay generally between 0.1 to 0.3 m bgl, over
- **Recent Alluvium (Holocene)** – Compressible, inter-bedded sandy clays, clayey sandy gravels and clayey sands (Upper Holocene) from approximately 0 to 3 m bgl (target depth).

8.2 Groundwater Levels

Table 5 summarises the groundwater measurements for the current investigation. Based on the measured groundwater levels, the general flow direction beneath the site is interpreted to be west.

Table 5: Summary of Groundwater Level Observations

Well ID	Depth to Groundwater (m bgl)	Groundwater Level (m AD)	Date and Time of Observations
AM-BH10	1.19	1.18	25/10/2016 AT 10:50 AM
AM-BH14	2.57	1.51	25/10/2016 AT 09:10 AM
AM-BH15	1.90	1.24	25/10/2016 AT 10:00 AM
AM-BH16	1.55	0.87	25/10/2016 AT 08:10 AM

8.3 ASS Screening Tests

The pH_F/pH_{FOX} screening method consists of two steps; determining the field pH of a 1:5 soil/water suspension, and by the addition of 30% Hydrogen Peroxide, allowing the sample time to oxidise, before determining the pH_{FOX} (pH after oxidation) of the reacted sample. A significant drop in pH is indicative of potential acidity and a low initial pH, indicative of actual acidity.

The tests are used to indicate the likelihood of a soil containing actual acidity (i.e. Actual ASS [AASS]) and/or potential acidity (i.e. Potential ASS [PASS]).

The following rating is used in the assessment of samples in the attached table:

1) AASS potential is indicated by; Nil (pH_F > 4.5), Medium (pH_F 4.5< pH_F ≤ 4), High (pH_F < 4)

2) PASS potential is indicated by: Low (pH_{FOX} > 3), Medium (pH_{FOX} > 3 and difference between pH_{FOX} and pH_{FOX} is greater than 3, High (pH_{FOX} < 3).

3) Where the pH_{FOX} value is significantly less than the reported pH_F, this may indicate the presence of PASS, with larger reductions in pH_{FOX} generally providing a stronger indication of potential PASS.

The strength of reaction is also an indicator of likely PASS.

Field screening test results on recovered soil samples during the investigation are presented in Appendix B and summarised in Table 6 below.

Table 6: Acid Sulfate Soil Screening Test Results

Location ID	Sample Depth Range (m bgl)			Sample Depth Range (m AD)			Sampled Date	Soil Type	pH (F)	AASS Likelihood[1]	pH (Field ox)	Reaction Rate[2]	PASS Likelihood[3]

AM-BH29	2.75	-	3	0.2	-	-0.05	7/10/2016	Sandy CLAY	7.5	Nil	2.4	4	High

The screening test results from the Stage 2 investigation indicated the following:

- The pH_F values materials ranged between 4.0 and 9.1. The possible presence of AASS was indicated at AM-BH18 (0.50-2.25m), AM-BH25 (0.25-0.50m), AM-BH26 (1.50-3.00m) and AM-BH29 (1.0-1.25m) which extends below the measured water table.
- The pH_{FOX} values suggest a high potential for PASS at all locations except for AMBH25 and AMBH26. The high potential for PASS was recorded at the remaining locations at the following depth ranges:
  - AMBH10: 0.25 mbgl to 3.00 mbgl
  - AMBH13: 1.75 mbgl to 2.00 mbgl
  - AMBH14: 0.50 mbgl to 1.75 mbgl
  - AMBH15: 0.00 mbgl to 0.25 mbgl and 2.50 mbgl to 3.0 mbgl
  - AMBH16: 0.50 mbgl to 0.75 mbgl and 2.75 mbgl to 3.0 mbgl
  - AMBH18: 0.25 mbgl to 2.75 mbgl
  - AMBH24: 1.25 mbgl to 2.75 mbgl
  - AMBH29: 0.75 mbgl to 1.50 mbgl and 2.50 mbgl to 3.0 mbgl

8.4 Chromium Suite Analysis

Based on screening test results, a total of 30 soil samples (about 2 to 3 samples per borehole) were selected for laboratory analysis by the Chromium Suite test methods. The soil samples were selected to target field screening tests suggesting high AASS or PASS potential and to provide a broad coverage of the soil profile.

Results of laboratory testing including acid base accounting to calculate net acidity are summarised in Table 7.

Laboratory results indicated:

- The presence of AASS was confirmed in layers sometimes inconsistent with indications from the field screening tests. Layers of AASS were indicated in AM-BH10, AM-BH13, AM-BH14, AM-BH16, AM-BH24, AM-BH25 and AM-BH29 where field screening had not previously indicated AASS. Closer inspection of these results suggests that minor oxidisation may have occurred these samples at the laboratory between field screening and the Chromium Suite testing – for the purposes of this assessment we have considered these suspect results to indicate PASS rather than AASS. Calculated liming rates to address existing acidity in AASS materials range from about 3 kg/m^3 to 13 kg/m^3.
- Net Acidity in PASS materials varies considerably across the site. In general the identified PASS material towards the southwestern quadrant have indicated liming rates ranging from about 3 to 14.2 kg/m^3. Through the centre of the site (AM-BH18) a liming rate in shallow material of 12.9 kg/m^3 was calculated. The highest net acidities were recorded along the north-western boundary at AM-BH10 which require a liming rate of about 284 kg/m^3)

Table 7: Summary of Acid Sulfate Soil Test Results (Chromium Suite)

Test Location	Depth Range (m - BGL)		Material Description	pH_{KCl}	sTAA (%S)	S_{NAS} (if pH less than 4.5)	Existing Acidity %S (sTAA + 0.75 x S_{NAS})	Chromium Reducible Sulfur (S_{CR}) %S	Acid Neutralising Capacity %CaCO3 (if pH more than 6.5)	Net Acidity %S (S_{CR}+Existing Acidity - ANC/FF)	Is This AASS	Is This PASS	Liming Rate for Existing Acidity (Neutralises AASS only) (kg/m3)	Liming Rate for Net Acidity (Neutralises both AASS & PASS) (kg/m3)

Liming rates assume a bulk density of 1.60t/m3
Fineness Factor: 1.5

8.5 Groundwater Quality

The laboratory results of groundwater analysed for ASS parameters presented in Appendix B and summarised in Table 8, below.

Table 8: Groundwater Quality Test Results

Sample Location	Sample Dates	pH*	EC mS/cm	Dissolved Fe mg/L	Dissolved Al mg/L	Cl^-: SO_4^{++} mgL (Ratio)	Total Acidity mg/L	Total Alkalinity mg/L
AM-MW10	25/10/16	6.99	51.4	<0.05	<0.05	8.6	260	297
AM-MW14	25/10/16	6.26	20.4	87.6	0.08	2.6	570	362
AM-MW15	25/10/16	6.43	9.12	7.58	<0.01	2.4	218	185
AM-MW16	25/10/16	6.06	14.8	87.6	<0.01	2.78	388	95

Notes: Rainfall in the 30 days prior to 25/10/2016 sampling round was 75.6mm.

The laboratory results indicated:

- Electrical conductivity ranging from 9 to 51 mS/cm indicating brackish to saline water conditions.
- pH levels ranging from 6.06 to 6.99 indicating slightly acidic to near neutral conditions.
- Total acidity exceeds total alkalinity in three of the four groundwater samples. The fourth sample has alkalinity marginally higher than acidity. These results indicate a very low buffering capacity across the site. The groundwater is interpreted to have a Class 4 buffering capacity (i.e. inadequate to maintain stable, acceptable pH level in areas vulnerable to acidification).
- Dissolved aluminium concentrations of greater than about 1 mg/L in groundwater may be an indicator of AASS. Concentrations were below the laboratory detection limit, with the exception of AM-BH14 (0.08 mg/L).
- Dissolved iron concentrations ranged from <0.05 to 87.6 mg/L.
- The Chloride:Sulfate (Cl^-: SO_4^{++}) ratios general ndicate past oxidation of PASS in this area.

Overall the groundwater results suggest a variable or historically disturbed environment at the investigation locations.

9.0 CONCLUSIONS

The following conclusions have been drawn from the ASS assessment at the Auto Precinct Stage 2 area:

- Investigations of the Stage 2 area indicated that AASS materials are present from the ground surface to levels about -0.13 m AD. AASS has been detected in materials below the water table (at AM-BH10) which indicates that the groundwater table has been historically lowered in this area. Calculated liming rates to neutralise existing acidity in the identified AASS materials range from about 3 kg/m^3 to 13 kg/m^3.
- Investigations of the Stage 2 area indicated that PASS materials are present approximately from 3.33 AD to -0.33 AD and throughout the sampling locations aside from AMBH25. In general the PASS material towards the southwestern quadrant have indicated liming rates ranging from about 3 to 14.2 kg/m^3. Through the centre of the site (AM-BH18) a liming rate in shallow material of 12.9 kg/m^3 was calculated. The highest net acidities were recorded along the northwestern boundary at AM-BH10 which recorded a projected liming requirement of up to about 284 kg/m^3 at AMBH10 (2.50-2.75).
- Acid conditions and aluminium concentrations above the Airports (Environmental Protection) Regulations accepted limit were not detected in the groundwater samples analysed. Groundwater samples suggested that whilst the groundwater currently has a pH in the slightly acidic to neutral range, it generally has inadequate buffering capacity to maintain stable, acceptable pH level in the presence of minor acid generation.

The presence of ASS and low buffering capacity of groundwater have the following implications to the currently proposed development

- All site excavations will disturbed ASS and will require management measures including lime treatment of excavated spoil. Excavations may result in AASS and PASS spoil which may require separate management measures.
- Filling and surcharging/preloading of the site will result in further AASS being "pushed" below the water table. Surcharging/preloading will also cause a slight mounding of the local water table and result in the temporary saturation of AASS. Both of these issues will result in the release of acid to the groundwater and the subsequent stripping and mobilisation of metals. Acid and metals impacted groundwater may discharge to the surface and/or shallow drains immediately surrounding the site and migrate towards (and discharge into) Landers Pocket Drain. Potential mitigation/management strategies for this issue include:
  - Construction of a lime trench along the western site boundary (or eastern side of the proposed drain along this boundary) to buffer acidic groundwater moving off site. The lime trench would need to extend below the AASS/PASS interface and would comprise a slot trench filled with a mix of agricultural lime and limestone chips.
  - Placement of a 10m wide strip of surface lime 'guard layer' along the eastern and southern perimeters of the site under the edge of the fill embankment, prior to filling. This is to neutralise acidic seepage/runoff leaving the site along these boundaries.
  - Installation of limestone filled 'check' dams across internal surface drains during construction period and at the end of drains upstream of any connection with Landers Pocket Drain, to neutralise acid 'flushes' that may occur. Note that the limestone chips would require monitoring and regular replacement.
  - Monitoring and possible treatment of seepage water collected from any wick drains employed, before discharge off site.
- Formation of unlined drains below the current groundwater table may result in a zone of localised groundwater depression. Acid and metals impacted groundwater may discharge into the drain. Potential mitigation/management strategies for this issue include:
  - Option 1: Construct a concrete lined drain to maintain groundwater levels outside of the drain and prevent inflow of acidic and degraded groundwater.
  - Option 2: Placement of a lime trench on either side of the drainage channel to neutralise groundwater inflow (this may still allow iron and other metals to floc in the drain and could require additional management measures).

10.0 RECOMMENDATIONS

Based on the investigation findings at the Stage 2 Auto Mall Precinct, it is recommended that:

- A site specific ASS EMP be prepared to manage development disturbances across the Stage 2 area and surcharging practices.

11.0 IMPORTANT INFORMATION

Your attention is drawn to the document titled - "Important Information Relating to this Report", which is included in Appendix C of this report. The statements presented in that document are intended to inform a reader of the report about its proper use. There are important limitations as to who can use the report and how it can be used. It is important that a reader of the report understands and has realistic expectations about those matters. The Important Information document does not alter the obligations Golder Associates has under the contract between it and its client.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please be advised that sample "AM-BH26 0-0.1" was not received at the laboratory (denoted SNR on the scanned COC).**
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- **PFAS analysis will be conducted by ALS Environmental, Sydney, NATA accreditation no. 825, Site No. 10911 (Micro site no. 14913).**
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (14 days), Solid (60 days) from date of completion of work order.
- Analysis will be conducted by ALS Environmental, Brisbane, NATA accreditation no. 825, Site No. 818 (Micro site no. 18958).
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default to 15:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory for processing purposes and will be shown bracketed without a time component.

CERTIFICATE OF ANALYSIS

Work Order	: **EB1624693**	Page	: 1 of 78
Client	: **GOLDER ASSOCIATES**	Laboratory	: Environmental Division Brisbane
Contact	: MS KRYSTLE-RAE BIRAM	Contact	: Carsten Emrich
Address	: P O BOX 1734 MILTON QLD, AUSTRALIA 4064	Address	: 2 Byth Street Stafford QLD Australia 4053
Telephone	: +61 07 3721 5400	Telephone	: +61 7 3243 7222
Project	: 1538021	Date Samples Received	: 14-Oct-2016 16:00
Order number	: 1538021	Date Analysis Commenced	: 18-Oct-2016
C-O-C number	: ----	Issue Date	: 21-Oct-2016 17:01
Sampler	: MORGAN MIDGLEY		
Site	: Brisbane Airport		
Quote number	: ----		
No. of samples received	: 74		
No. of samples analysed	: 73		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alex Rossi	Organic Chemist	Sydney Organics, Smithfield, NSW
Andrew Epps	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Ben Felgendrejeris		Brisbane Acid Sulphate Soils, Stafford, QLD
Matt Frost	Senior Organic Chemist	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EG005T (Total Metals): Sample EB1624693-002 shows poor duplicate results due to sample heterogeneity. Confirmed by visual inspection.
- ASS: EA037 (Rapid Field and F(ox) screening): pH F(ox) Reaction Rate: 1 - Slight; 2 - Moderate; 3 - Strong; 4 - Extreme
- EA037 ASS Field Screening: NATA accreditation does not cover performance of this service.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.

Project	: 1538021	Date Samples Received	: 14-Oct-2016
Order number	: 1538021	Date Analysis Commenced	: 18-Oct-2016
C-O-C number	: ----	Issue Date	: 21-Oct-2016
Sampler	: MORGAN MIDGLEY		
Site	: Brisbane Airport		
Quote number	: ----		
No. of samples received	: 74		
No. of samples analysed	: 73		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alex Rossi	Organic Chemist	Sydney Organics, Smithfield, NSW
Andrew Epps	Senior Inorganic Chemist	Brisbane Inorganics, Stafford, QLD
Ben Felgendrejeris		Brisbane Acid Sulphate Soils, Stafford, QLD
Matt Frost	Senior Organic Chemist	Brisbane Organics, Stafford, QLD

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB1624693**	Page	: 1 of 9
Client	: **GOLDER ASSOCIATES**	Laboratory	: Environmental Division Brisbane
Contact	: MS KRYSTLE-RAE BIRAM	Telephone	: +61 7 3243 7222
Project	: 1538021	Date Samples Received	: 14-Oct-2016
Site	: Brisbane Airport	Issue Date	: 21-Oct-2016
Sampler	: MORGAN MIDGLEY	No. of samples received	: 74
Order number	: 1538021	No. of samples analysed	: 73

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Duplicate (DUP) RPDs							
EG005T: Total Metals by ICP-AES	EB1624693--002	AM-BH26 0.25-0.5	**Chromium**	7440-47-3	22.2 %	0% - 20%	**RPD exceeds LOR based limits**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.
